#### Forest Service Research: Customer Expectations

B. Bruce BareDean, College of Forest ResourcesUniversity of WashingtonSeattle, WA

February 10, 2004

### Critical Role of Research

- Good <u>natural resources</u> and <u>environmental</u> stewardship <u>decision making</u> requires good <u>science</u>
- Research must <u>integrate</u> the <u>ecological</u>, <u>economic</u> and <u>social</u> sciences to advance the science of <u>sustainability</u>
- Inherent <u>uncertainties</u> and <u>limitations</u> must be made clear to users of the research
- Researchers must acknowledge the role <u>values</u> play in the research and decision processes

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

#### Utilize the <u>scientific</u> <u>method</u> –

- Properly frame the *issues*
- Formulate the <u>question</u> or <u>hypothesis</u>
- Design proper <u>experiments</u> or <u>surveys</u>
- Analyze <u>results</u>
- Draw proper <u>conclusions</u> and <u>inferences</u>
- Publish in peer reviewed literature
- Communicate to broad audience

Objective

- <u>Beliefs</u> and <u>values</u> of the scientist may <u>influence</u> this process
- <u>How</u> does the scientist <u>learn</u> about the questions?
- The formation of <u>questions</u> or <u>testable hypotheses</u> is challenging and can introduce unintended <u>biases</u>

Objective

- Illustration of <u>hypothesis</u> formation (asking the right question)
  - Suppose we wish to <u>support</u> a <u>claim</u> that more than 65% of the LS/OG reserves in western Washington national forests contain northern spotted owls
    - <u>Null</u> hypothesis:  $\rho \le .65$  (assumed to be true)
    - <u>Alternative</u> hypothesis:  $\rho > .65$  (claim)

- The hypothesis with an <u>equality</u> sign is the <u>null</u> and its complement the <u>alternative</u>
- To <u>support</u> a <u>claim</u> it must defined as the <u>alternative</u> hypothesis
- We assume that the <u>null</u> hypothesis is <u>true</u>
- We always <u>test</u> the <u>null</u> hypothesis and either <u>reject</u> it as <u>false</u> or <u>fail</u> to <u>reject</u> it

- <u>Suppose</u> our <u>sample survey</u> data yields a <u>mean</u> percentage of 0.67 based on a sample size of n = 35
- In this case, we <u>fail</u> to <u>reject</u> the <u>null</u> hypothesis
- There is insufficient evidence to <u>support</u> the <u>claim</u> that <u>more than</u> 65% of the LS/OG reserves contain northern spotted owls
- If the <u>null</u> is <u>true</u> (as we believe) a <u>correct</u> decision is made
- If not, an <u>error</u> has been committed and we try to keep this error rate rather low – usually around 5%

- As an aside, we note that researches are concerned with <u>two</u> types of <u>errors</u> –
  - <u>Rejecting</u> a <u>true</u> null hypothesis (akin to sending an innocent person to jail) Type I error
  - <u>Failing</u> to reject a false null hypothesis (akin to letting a guilty person go free) Type II error
- If we try to <u>decrease</u> one type of error the other <u>increases</u>
- To <u>decrease</u> both types of error we need <u>larger</u> sample sizes at <u>increased</u> expense

- Suppose we <u>alter</u> the statement to <u>support</u> a <u>claim</u> that more than 50% of the LS/OG reserves in western Washington national forests contain northern spotted owls
  - <u>Null</u> hypothesis:  $\rho \le .5$  (assumed to be true)
  - <u>Alternative</u> hypothesis:  $\rho > .5$  (claim)
  - Now, we <u>reject</u> the <u>null</u> hypothesis and conclude that the <u>alternate hypothesis</u> is probably true

- Which <u>claim</u> and/or <u>hypothesis</u> is more <u>legitimate</u>?
- Key is <u>formulate</u> the testable <u>hypothesis</u> <u>prior</u> to collecting the data
- How does a researcher <u>decide</u>?
- Other hypotheses are also possible -- to <u>refute</u> a claim we set it up such that the <u>claim</u> is placed in the <u>null</u> hypothesis

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

# High Quality

- <u>Scientists</u> conducting the research are well <u>qualified</u>
- All <u>research</u> must meet existing <u>scientific protocols</u>
- <u>Experimental</u> and <u>survey</u> procedures used are well designed and executed
- Publications <u>peer-reviewed</u>

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

#### Relevant

- Focus science on key issues of relevance to society
- Take an <u>interdisciplinary</u> and <u>integrated</u> view
- Involve <u>multiple</u> scales from <u>stand</u> to <u>landscape</u> levels to capture <u>synergistic</u> effects of <u>sustainability</u>
- <u>Social</u>, <u>economic</u> and <u>ecological</u> metrics must be kept in <u>balance</u> in <u>research</u> program

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

# Timely

- Conduct <u>both</u> short-term and long-term studies
- Involve <u>universities</u> in the latter to maintain data warehouse
- Establish <u>monitoring</u> activities in conjunction with on-going <u>adaptive</u> management to promote shortterm efforts
- <u>Disseminate</u> information as <u>rapidly</u> as possible

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

#### Balanced

- <u>Long-term</u> vs. <u>short-term</u> research
- Conduct research across the <u>ecological</u>, <u>social</u> and <u>economic</u> disciplines and seek new discoveries at the <u>boundaries</u>

- <u>Research</u> should be—
  - Objective and impartial
  - High quality
  - Relevant
  - Timely
  - Balanced
  - Well communicated

### Well Communicated

- Publish in <u>peer</u> reviewed outlets
- Condense <u>key</u> findings into short and easy to read news letters
- Place all findings on the <u>web</u>
- Utilize <u>streaming video</u> and other <u>technologies</u> to expand audience acceptance

- It may <u>not</u> be <u>sufficient</u> to <u>conclude</u> the <u>research</u> process with the <u>communication</u> of <u>results</u>
- How can we ensure that <u>scientists</u>, <u>resource</u> <u>professional</u> and <u>policy makers</u> are asking the <u>right</u> questions?
- <u>Convene</u> knowledgeable parties in a neutral <u>forum</u> where <u>open discussions</u> take place prior to initiation of research

- The forum can perform five functions
  - Decision Making (1) Stakeholders and decision makers can discuss complex and often contentious issues in a neutral and science-rich setting
  - Collaborative Analysis (2) Scientists and policy staff can collaborate on research and analytical work that supports decision-making

- The forum can perform five functions
  - Information Repository (3) Complex projects need access to multiple databases and other information that often exist at dispersed locations
  - Educational Observatory (4) Forum space can have access for classroom interaction and student participation and work

- The <u>forum</u> can perform five functions
  - Research Aimed at Long-Term Solutions (5) The collaborative working partners can introduce existing knowledge into deliberations
- Possible forum <u>topics</u> include
  - Wild fire in the West
  - Climate change
  - Water resource issues

#### The End
