# An Alternate Way to Solve Equilibrium Problems 

J. B. Callis<br>University of Washington

In this essay we describe an alternative to solving equilibrium problems by the 'ICE' method (see e.g. problem 18-2 of your lecture notes). This alternative method is based on the conservation of mass and charge, concepts you have already used in the balancing of chemical equations. While a bit more trouble to use on simple problems, it clearly shows how the constraints of mass conservation enter into the solution.

We start by considering the following equilibrium system:

$$
\begin{equation*}
\mathrm{CO}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})=\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g}) \tag{1}
\end{equation*}
$$

Assume that the initial concentrations are

$$
[\mathrm{CO}]_{0}=\left[\mathrm{H}_{2} \mathrm{O}\right]_{0}=\mathrm{A}_{0} ; \quad\left[\mathrm{CO}_{2}\right]_{0}=\left[\mathrm{H}_{2}\right]_{0}=0
$$

where $\mathrm{A}_{0}$ is a constant, e.g. $=2.0 \mathrm{M}$.
Now define the sought for equilibrium concentrations in terms of abstract variables $u, v, x$ and $y$ as follows:

$$
\begin{equation*}
[\mathrm{CO}]=u ;\left[\mathrm{H}_{2} \mathrm{O}\right]=v ;\left[\mathrm{CO}_{2}\right]=x ;\left[\mathrm{H}_{2}\right]=y \tag{2}
\end{equation*}
$$

Then the abstract expression for K becomes:

$$
\begin{equation*}
K=\frac{\left[\mathrm{CO}_{2} \llbracket \mathrm{H}_{2}\right]}{[\mathrm{CO}]\left[\mathrm{H}_{2} \mathrm{O}\right]}=\frac{x y}{u v} \tag{3}
\end{equation*}
$$

Equation 3 is a non-linear equation in four unknowns. We can obtain three more (linear) equations by considering the conservation of mass in the following manner:

Conservation of carbon: $[\mathrm{CO}]_{0}+\left[\mathrm{CO}_{2}\right]_{0}=\mathrm{u}+\mathrm{x}$

Conservation of hydrogen: $2\left[\mathrm{H}_{2} \mathrm{O}\right]_{0}+2\left[\mathrm{H}_{2}\right]_{0}=2 \mathrm{v}+2 \mathrm{y}$
Conservation of oxygen: $[\mathrm{CO}]_{0}+\left[\mathrm{H}_{2} \mathrm{O}\right]_{0}+2\left[\mathrm{CO}_{2}\right]_{0}=\mathrm{u}+\mathrm{v}+2 \mathrm{x}$

Equations 4-6 can be simplified to:
Conservation of carbon: $\mathrm{A}_{0}=\mathrm{u}+\mathrm{x}$

Conservation of hydrogen: $A_{0}=v+y$

Conservation of oxygen: $2 \mathrm{~A}_{0}=\mathrm{u}+\mathrm{v}+2 \mathrm{x}$

Now we have four equations (3, 7, 8 and 9) in four unknowns ( $u, v, x$ and $y$ ). We then proceed to solve these equations for the variable $x$ by systematic elimination of the other three variables ( $\mathrm{y}, \mathrm{u}$ and v ).

In the first step of the elimination process, we rearrange Equation 7 to $u=A_{0}-x$. Now we can eliminate $u$ from Equations 3 and 9:

Equation 3 becomes: $K=\frac{x y}{\left(A_{0}-x\right) v}$

Equation 8 remains as: $\mathrm{A}_{0}=\mathrm{v}+\mathrm{y}$

Equation 9 becomes: $A_{0}=v+x$
The above are three equations ( 10,11 and 12) in three unknowns ( $v, x$ and $y$ ). Next, we eliminate $y$ from equations 10 and 12 by rearranging Equation 11 to $y=A_{0}-v$ and substituting:

Equation 10 becomes: $K=\frac{x\left(A_{0}-v\right)}{\left(A_{0}-x\right) v}$
Equation 12 remains as: $\mathrm{A}_{0}=\mathrm{x}+\mathrm{v}$
This leaves two equations in two unknowns. Now we eliminate $v$ from equation 13 by rearranging Equation 14 to $\mathrm{v}=\mathrm{A}_{0}-\mathrm{x}$ and substituting:

Equation 13 becomes:

$$
\begin{equation*}
K=\frac{x\left(A_{0}-A_{0}+x\right)}{\left(A_{0}-x\right)\left(A_{0}-x\right)} \tag{15}
\end{equation*}
$$

Upon simplification Equation 15 becomes:

$$
\begin{equation*}
K=\frac{x^{2}}{\left(A_{0}-x\right)\left(A_{0}-x\right)}=\frac{x^{2}}{\left(A_{0}-x\right)^{2}} \tag{16}
\end{equation*}
$$

This equation is identical to that of problem 18-2 obtained by the ICE method in Zumdahl.
