```
Lab 3: 2x2 Contingency table
```

For the third lab the class filled in a $2 \times 2$ contingency table according to
their morning habits: coffee drinker (Y/N) and breakfast eater (Y/N). The
table and class data are given below:

Observed:
Breakfast

|  | Coffee |  |  |
| :--- | :--- | :--- | :--- |
|  | Y | N | Total |
| Y | 36 | 25 | $\mid 61$ |
| N | 3 | 7 | 10 |
| Total | 39 | 32 | 71 |

This is a Chisq test of independence.
$\mathrm{H}_{0}$ : Eating breakfast is independent of drinking coffee
$H_{a}$ : There is an association between eating breakfast and drinking coffee
$\mathrm{H}_{0}: \mathrm{p}_{\mathrm{ij}}=\mathrm{p}_{\mathrm{i} . \mathrm{p}_{\mathrm{j}}}$
$\mathrm{H}_{\mathrm{a}}: \mathrm{p}_{\mathrm{ij}} \neq \mathrm{p}_{\mathrm{i} .} \mathrm{p}_{\mathrm{j}}$
With $\alpha=0.05,1 \mathrm{df}$, Chisq $_{0.05,1}=3.841$; Reject $\mathrm{H}_{0}$ if Chisq ${ }_{\text {obs }}>3.841$
Expected:
Coffee
Breakfast

|  | Y | N | Total |
| :--- | :--- | :--- | :--- |
| Y | $39 * 61 / 71$ | $32 * 61 / 71$ | $\mid 61$ |
| N | $39 * 10 / 71$ | $32 * 10 / 71$ | 10 |
| Total | 39 | 32 | $\mid 71$ |

Expected:
Coffee
Breakfast

|  | Y | N | Total |
| :--- | :--- | :--- | :--- |
| Y | $\mid 33.51$ | 27.49 | $\mid 61$ |
| N | 5.49 | 4.51 | 10 |
| Total | 39 | 32 | $\mid 71$ |

$\chi_{\text {obs }}^{2}=\frac{(36-33.51)^{2}}{33.51}+\frac{(25-27.49)^{2}}{27.49}+\frac{(3-5.49)^{2}}{5.49}+\frac{(7-4.51)^{2}}{4.51}=2.91<3.841$
Fail to reject $\mathrm{H}_{0}$ : Conclude that there is no evidence for an association between coffee drinking and eating breakfast.
Yate's Correction:
Cochran's Correction:
$|36 * 7-25 * 3|=177>71 / 2 \quad \hat{f}_{\text {min }}=4.51 ;\left|f-\hat{f}_{\text {min }}\right|=|7-4.51|=2.49<2 * 4.51 ; D=2.0$
$\chi_{Y}^{2}=\frac{71(177-33.5)^{2}}{39 * 32 * 61 * 10}=1.867$
$\chi_{C}^{2}=\frac{71^{3} * 2^{2}}{39 * 32 * 61 * 10}=1.880$
$1.867<1.880<2.91$
Fail to reject in all cases.
