Prostate Cancer Example

These data come from the Efron and Hastie book website:

<https://web.stanford.edu/~hastie/CASI/data.html>

```
# if (!requireNamespace('BiocManager', quietly =  
# TRUE)) install.packages('BiocManager')  
# BiocManager::install('qvalue')  
library(knitr)  
library(qvalue)  
library(locfdr)  
library(ashr)  
library(xtable)  
# download.file('http://faculty.washington.edu/kenrice/sisgbayes/prostz.txt',  
# destfile = 'prostz.txt')  
prostz <- read.table("prostz.txt", header = F, sep = ",")  
zvalues <- prostz$V1  
prostz = unlist(prostz)  
n = length(prostz)  
n  
## [1] 6033
```

Prostate Cancer Example

Histogram of z-values, with an $N(0,1)$ added is lower in the middle, with perhaps an excess of mass in the tails.

```
hist(prostz, nclass = 60, freq = F, ylim = c(0, 0.45),  
     main = "", xlab = "z-values")  
curve(dnorm(x), add = T, col = "red")
```

Prostate Cancer: Histogram of p -values

```
pvalues = 2 * pnorm(abs(prostz), mean = 0, sd = 1,  
  lower.tail = F)  
hist(pvalues, breaks = sqrt(n), main = "", xlab = "p-values")
```

Prostate Cancer: Bonferroni

```
alpha = 0.05
alpha.bon = alpha/n
alpha.bon
## [1] 8.287751e-06
which(pvalues < alpha.bon)
## V1332 V1610 V11720
## 332 610 1720
# Just to check:
which(p.adjust(pvalues, method = "bonferroni") < alpha)
## V1332 V1610 V11720
## 332 610 1720
```

Prostate Cancer Example

Holm's procedure

```
# hist(pvalues, breaks = sqrt(n))
levels = alpha/(n + 1 - seq(1, n))
pvalues.order = order(pvalues)
flag.index = pvalues.order[which(pvalues[pvalues.order] <=
    levels)]
flag.index
## [1] 610 1720 332
# If we don't want to do 'by hand' use this
# command: flag.index = which(p.adjust(pvalues,
# method = 'holm') < 0.05) #or use p.adjust function
# directly
```

Prostate Cancer Example: EFD

Control expected number of false discoveries (EFD)

```
EFD = 1
alpha.EFD = EFD/n
flag.index.1 = which(pvalues < alpha.EFD)
# flag.index.5
EFD = 5
alpha.EFD = EFD/n
flag.index.5 = which(pvalues < alpha.EFD)
# flag.index.5
```

Prostate Cancer Example: Benjamini Hochberg

```
alphaBHset = 0.1
levels = seq(1, n) * alpha/n
pvalues.order = order(pvalues)
alpha.BH = pvalues[order(pvalues)][max(which(pvalues[pvalues.order] <=
  levels)))]
# which(p.adjust(pvalues, method = 'BH') < 0.05) commented out because
# there are a lot of them

# which(pvalues < alpha.BH)

# which(p.adjust(pvalues, method = 'BH') < 0.1) which(p.adjust(pvalues,
# method = 'BH') < 0.2)
```

Multiple testing example

```
expp <- seq(1, n)/(n + 1)
psort <- sort(pvalues)
plot(expp, psort, xlim = c(0, 1), ylim = c(0, 1), ylab = "Observed p",
      xlab = "Expected p")
abline(h = 0.05/n, col = "blue")
abline(h = 1/n, col = "red")
abline(h = 5/n, col = "orange")
abline(a = 0, b = 1)
lines(expp, alphaBHset * seq(1, n)/n, col = "green")
legend("topleft", legend = c("Bonferroni 5%", "EFD=1",
  "EFD=5", "FDR 5%"), col = c("blue", "red", "orange",
  "green"), bty = "n", lwd = 2)
```

Multiple testing example

Multiple testing example

```
# Try again with focus pdf('multtestfig0new2.pdf')
plot(expp, psort, xlim = c(0, 0.01), ylim = c(0, 0.01),
      ylab = "Observed p", xlab = "Expected p")
abline(h = 0.05/n, col = "blue")
abline(h = 1/n, col = "red")
abline(h = 5/n, col = "orange")
abline(a = 0, b = 1)
# points(expp, alpha*seq(1,m)/m, pch=25)
lines(expp, alphaBHset * seq(1, n)/n, col = "green")
legend("bottomright", cex = 0.8, legend = c("Bonferroni 5%",
      "EFD=1", "EFD=5", "FDR 5%"), col = c("blue", "red",
      "orange", "green"), bty = "n", lwd = 2)
# dev.off()
```

Multiple testing example

q-values

```
pvalues <- sort.int(pvalues, index.return = T)
qobj10 = qvalue(p = pvalues, fdr.level = 0.1)
q10 <- which(qobj10$significant)
hist(pvalues[which(qobj10$significant)], main = "Distribution of significant p-  
xlab = "p-value")
```

Distribution of significant p-values

Multiple testing example

```
alphaBHset = 0.1
plot(-log10(expp), -log10(psort), ylim = c(0, ymax),
     xlab = "-log10(expected)", ylab = "-log10(observed)",
     type = "n")
points(-log10(expp)[-c(1:length(q10))], -log10(psort)[-c(1:length(q10))],
       col = "blue")
points(-log10(expp)[c(1:length(q10))], -log10(psort)[c(1:length(q10))],
       col = "red")
lines(-log10(expp), -log10(alphaBHset * seq(1, n)/n),
      col = "green")
legend("topleft", legend = c("Significant via q-value 10% FDR",
                             "Not significant"), col = c("red", "blue"), bty = "n",
      pch = 1)
legend("bottomright", legend = c("BH FDR 10%"), col = c("green"),
      bty = "n", lwd = 2)
```

Multiple testing example

q-values

```
qobj20 = qvalue(p = pvalues, fdr.level = 0.2)
# which(qobj20$significant)

# estimated proportion of null p-values
qobj20$pi0
## [1] 0.8544683
```

Local FDR

Evaluate the number passing each condition, using a natural spline to estimate f

```
out0 = locfdr(zvalues, nulltype = 0, type = 0)
which(out0$fdr < 0.1)
## [1] 332 364 579 610 735 914 1068 1077 1089 1113 1130 1557 1720 3375 36
## [16] 3665 3940 3991 4073 4088 4316 4331 4518 4546 4549
summ_table_x0 <- xtable(out0$fp0, digits = 3)
print(summ_table_x0, include.rownames = T, comment = FALSE)
## \begin{table}[ht]
## \centering
## \begin{tabular}{rrrr}
## \hline
## &  $\delta$  &  $\sigma$  &  $p_0$  \\
## \hline

## cmeSD & 0.033 & 0.046 & 0.029 \\
## \hline
## \end{tabular}
## \end{table}
```

Local FDR

Evaluate the number passing each condition using a polynomial to estimate f

```
out1 = locfdr(zvalues, nulltype = 0, type = 1, plot = 0)
which(out1$fdr < 0.1)
## [1] 332 364 579 610 914 1068 1077 1089 1113 1557 1720 3375 3647 3940 39
## [16] 4073 4088 4316 4331 4518 4546
summ_table_x1 <- xtable(out1$fp0, digits = 3)
print(summ_table_x1, include.rownames = T, comment = FALSE)
## \begin{table}[ht]
## \centering
## \begin{tabular}{rrrr}
## \hline
## &  $\delta$  &  $\sigma$  &  $p_0$  \\
## \hline
## thest & 0.000 & 1.000 & 0.941 \\
## theSD & 0.000 & 0.000 & 0.010 \\
## mlest & 0.003 & 1.087 & 0.998 \\
## mleSD & 0.019 & 0.023 & 0.009 \\
## cmest & -0.004 & 1.025 & 0.961 \\
## cmeSD & 0.026 & 0.022 & 0.010 \\
## \hline
## \end{tabular}
## \end{table}
```

Homemade MCMC

```
# download.file('http://faculty.washington.edu/kenrice/sisgbayes/prostmat.csv',  
# destfile = 'prostmat.csv')  
prostmat <- read.csv("prostmat.csv")  
n = dim(prostmat)[1]  
X.bar = apply(prostmat, 1, function(x) sum(x[1:50])/50)  
Y.bar = apply(prostmat, 1, function(x) sum(x[51:102])/52)  
Y = Y.bar - X.bar  
s02 = apply(prostmat, 1, function(x) var(x[1:50]))  
s12 = apply(prostmat, 1, function(x) var(x[51:102]))  
sigma2 = s02/50 + s12/52  
alpha = 0.05
```

Code is not sent to screen, but carries out Gibbs sampling for the mixture model described in class.

Prostate Cancer Example:

Local false sign rate approach

```
out = ash.workhorse(betahat = Y, sebetahat = sqrt(sigma2),
  mixcompdist = c("normal"), method = c("fdr"))
result = out$result
# it is a large dataframe containing
# positive probability, negative
# probability, lfsr, lfdr ect.
names(result)
## [1] "betahat"          "sebetahat"        "NegativeProb"     "PositiveProb"
## [5] "lfsr"             "svalue"           "lfdr"             "qvalue"
## [9] "PosteriorMean"    "PosteriorSD"
# out$fitted_g for fitted model
out$fitted_g$pi[1] # Posterior mass on null component
## [1] 0.839573
```

Local false sign rate approach

```
head(result)
```
