```
library(hwde)
n1 <- 88
n2 <- 10
n3 <- 2
exact <- hwexact(n1,n2,n3)

Functions of interest: implied priors

We assume a “dirichlet(1,1,1)” distribution

```

q1 <- q[,1]
q2 <- q[,2]
q3 <- q[,3]
p1 <- q1+q2/2
p2 <- q3+q2/2;
f <- (q1-p1^2)/(p1*p2)
D <- q1-p1^2
psi <- q2^2/(p1*p2)
## Functions of interest
cat("Prior prob f>0: ",sum(f>0)/nsim,"\\n")
## Prior prob f>0:  0.66576

```

```

cat("Prior prob D>0: ",sum(D>0)/nsim,"\\n")
## Prior prob D>0:  0.66576

```

Examine prior summaries for different functions of interest.

```

par(mfrow=c(1,3))
hist(p1,main="",xlab=expression(p[1]),cex.lab=1.5)
hist(p2,main="",xlab=expression(p[2]),cex.lab=1.5)
hist(D,main="",xlab=expression(D),cex.lab=1.5)

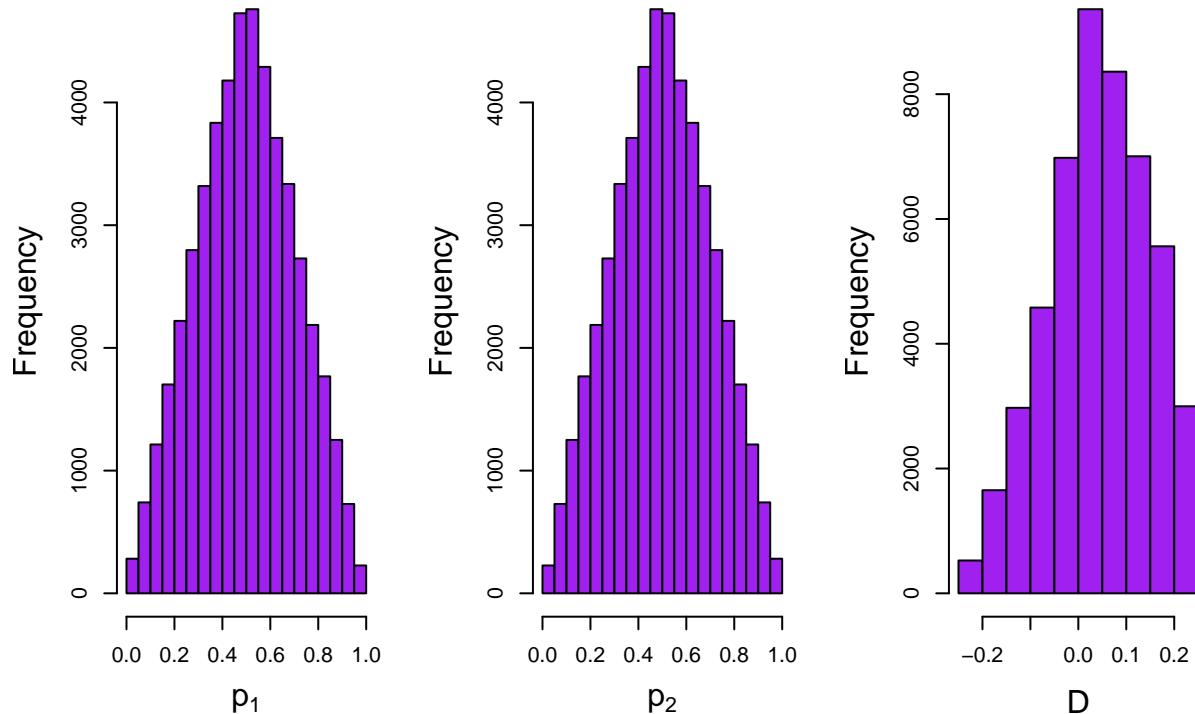

```

```

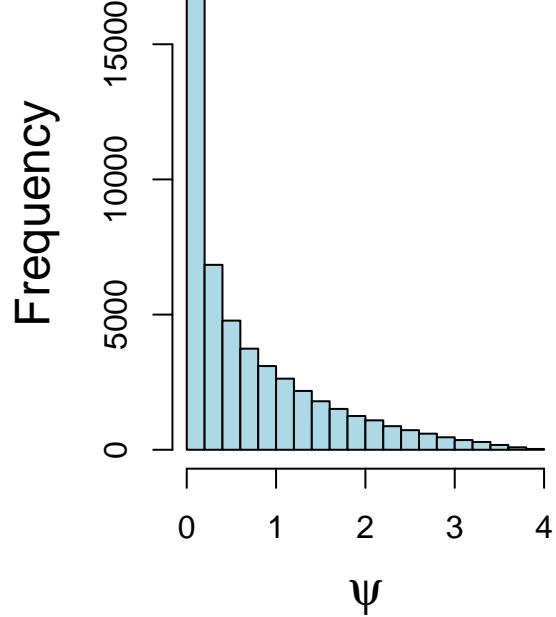

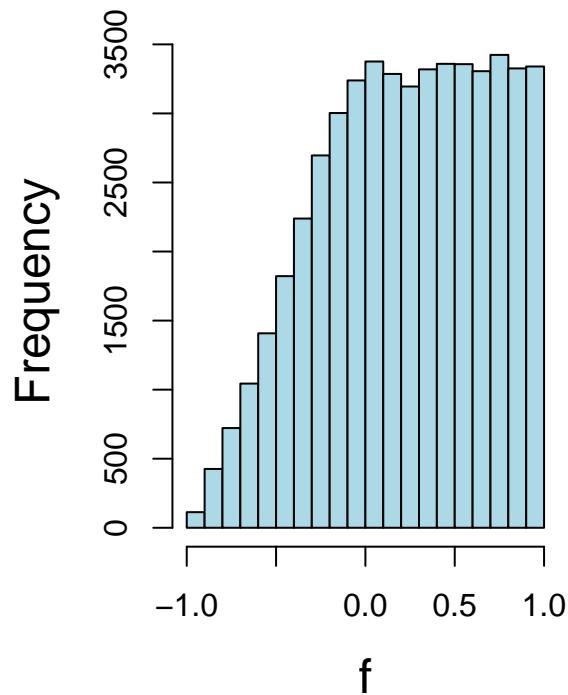

par(mfrow=c(1,2))
hist(f,main="",xlab="f",cex.lab=1.5)
hist(psi,main="",xlab=expression(psi),cex.lab=1.5)

```

Inference for f

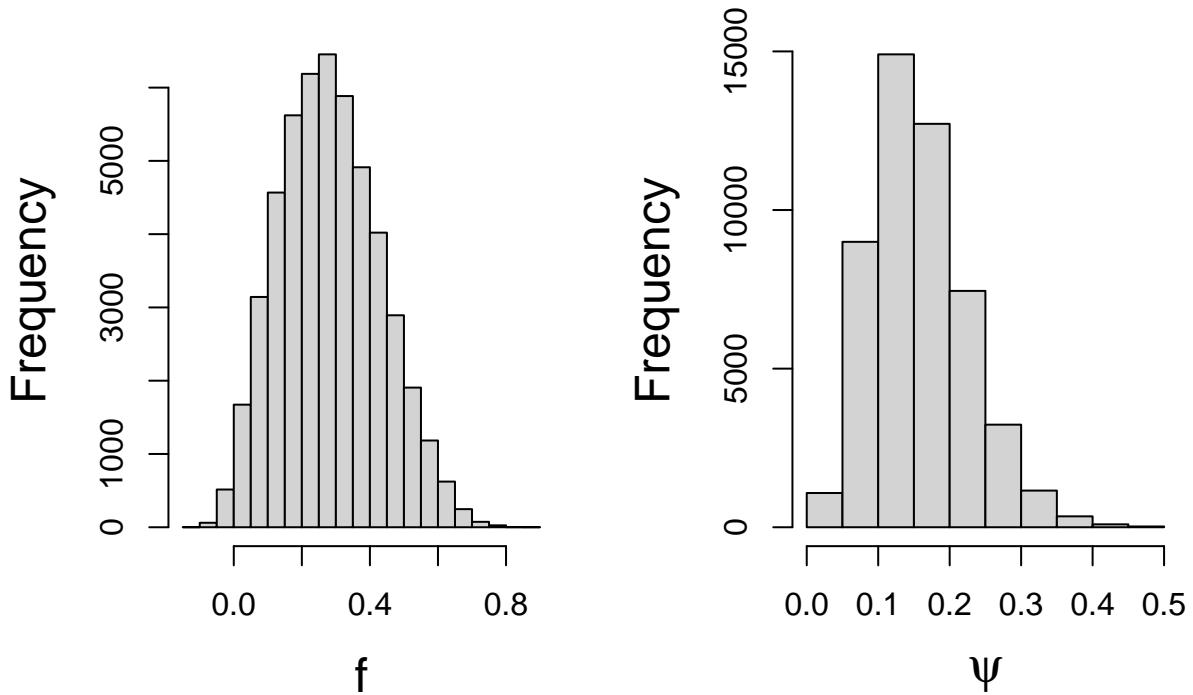

The MLE is $\hat{f} = 0.23$ with asymptotic standard error 0.17.

Hence, a 95% asymptotic confidence interval is

$$(0.23 - 1.96 \times 0.17, 0.23 + 1.96 \times 0.17) = (-0.1032, 0.5632).$$

Exercises

- Repeat the analyses in these notes for the Lidicker et al data discussed in class, ie with $n_1 = 37$, $n_2 = 20$, $n_3 = 7$. In particular, with a Dirichlet(1,1,1) prior on the 3 probabilities, generate samples, and examine the various summaries, including marginal allele frequencies and the inbreeding coefficient f .
- Download and install the INLA package from the website in the course notes. Run the LHON example using the commands from the slides. If you get this to work, repeat the Session 3 exercise switching the informative prior from β_1 to β_0 .
