ColdFire Instruction Timing

from

http://www.freescale.com/files/dsp/doc/ref_manual/MCF5282UM.pdf

2.8 Instruction Execution Timing

This section presents V2 processor instruction execution times in terms of processor core clock cycles. The number of operand references for each instruction is enclosed in parentheses following the number of processor clock cycles. Each timing entry is presented as C(R/W) where:

- C is the number of processor clock cycles, including all applicable operand fetches and writes, and all internal core cycles required to complete the instruction execution.
- R/W is the number of operand reads (R) and writes (W) required by the instruction. An operation performing a read-modify-write function is denoted as (1/1).

This section includes the assumptions concerning the timing values and the execution time details.

2.8.1 Timing Assumptions

For the timing data presented in this section, the following assumptions apply:

1. The operand execution pipeline (OEP) is loaded with the opword and all required extension words at the beginning of each instruction execution. This implies that the OEP does not wait for the instruction fetch pipeline (IFP) to supply opwords and/or extension words.
2. The OEP does not experience any sequence-related pipeline stalls. For V2 ColdFire processors, the most common example of this type of stall involves consecutive store operations, excluding the MOVEM instruction. For all STORE operations (except MOVEM), certain hardware resources within the processor are marked as "busy" for two processor clock cycles after the final DSOC cycle of the store instruction. If a subsequent STORE instruction is encountered within this 2-cycle window, it will be stalled until the resource again becomes available. Thus, the maximum pipeline stall involving consecutive STORE operations is 2 cycles. The MOVEM instruction uses a different set of resources and this stall does not apply.

3. The OEP completes all memory accesses without any stall conditions caused by the memory itself. Thus, the timing details provided in this section assume that an infinite zero-wait state memory is attached to the processor core.
4. All operand data accesses are aligned on the same byte boundary as the operand size: that is, 16 bit operands aligned on 0-modulo-2 addresses and 32 bit operands aligned on 0-modulo-4 addresses.

If the operand alignment fails these guidelines, it is misaligned. The processor core decomposes the misaligned operand reference into a series of aligned accesses as shown in Table 2-10.

Table 2-10. Misaligned Operand References

Address[1:0]	Size	Xbus Operations	Additional C(R/W)
X1	Word	Byte, Byte	2(1/0) if read 1(0/1) if write
X1	Long	Byte, Word, Byte	3(2/0) if read 2(0/2) if write
10	Long	Word, Word	2(1/0) if read 1(0/1) if write

2.8.2 MOVE Instruction Execution Times

The execution times for the MOVE.{B,W} instructions are shown in Table 2-11, while Table 2-12 provides the timing for MOVE.L.

For all tables in this section, the execution time of any instruction using the PC-relative effective addressing mode is the same for the comparable An-relative mode.

The nomenclature "xxx.wl" refers to both forms of absolute addressing, xxx.w and xxx.l.

Table 2-11. Move Byte and Word Execution Times

Source	Destination						
	Rx	(Ax)	(Ax)+	-(Ax)	(d_{16},Ax)	(d_8,Ax,Xi)	(xxx).wl

move.l	Raccext01,<ea.x	1(0/0)	—	—	—	—	—	—	—
move.l	Raccext23,<ea>x	1(0/0)	—	—	—	—	—	—	—

[1] Effective address of (d16,PC) not supported

[2] Storing an accumulator requires one additional processor clock cycle when saturation is enabled, or fractional rounding is performed (MACSR[7:4] = 1---, -11-, --11)

NOTE

The execution times for moving the contents of the Racc, Raccext[01,23], MACSR, or Rmask into a destination location <ea>x shown in this table represent the *best-case scenario* when the store instruction is executed and there are *no* load or M{S}AC instructions in the EMAC execution pipeline. In general, these store operations require only a single cycle for execution, but if preceded *immediately* by a load, MAC, or MSAC instruction, the depth of the EMAC pipeline is exposed and the execution time is four cycles.

2.13 Branch Instruction Execution Times

Table 2-17. General Branch Instruction Execution Times

Opcode	<EA>	Effective Address
