## **Discrete Optimization**

### Ngày 8 tháng 9 năm 2011

In this lecture we shall learn how to solve the assignment problem efficiently.

In this lecture we shall learn how to solve the assignment problem efficiently.

(The Hungarian Method) *Observations:* 

In this lecture we shall learn how to solve the assignment problem efficiently.

## (The Hungarian Method)

Observations:

Recall: a solution to an n × n assignment problem is an n – permutation : [i<sub>1</sub>, i<sub>2</sub>, ... i<sub>n</sub>]

In this lecture we shall learn how to solve the assignment problem efficiently.

## (The Hungarian Method)

Observations:

Recall: a solution to an n × n assignment problem is an n – permutation : [i<sub>1</sub>, i<sub>2</sub>, ... i<sub>n</sub>]

In this lecture we shall learn how to solve the assignment problem efficiently.

## (The Hungarian Method)

Observations:

Recall: a solution to an n × n assignment problem is an n – permutation : [i<sub>1</sub>, i<sub>2</sub>, ... i<sub>n</sub>]

### Definition

Two assignment problems of size n are *equivalent* if any n - permutation which is optimal to one problem is also optimal for the other.

# The Hungarian Method, preliminaries

#### Example

		C1	C2	СЗ	C4		<i>P</i> <sub>1</sub>	<i>P</i> <sub>2</sub>	<i>P</i> <sub>3</sub>	$P_4$
٩	J1	45	112	114	216	<i>W</i> <sub>1</sub>	31	351	123	103
	J2	95	52	104	235	<i>W</i> <sub>2</sub>	91	51	123	103
	J3	90	95	80	180	<i>W</i> <sub>3</sub>	81	351	43	103
	J4	95	133	141	75	$W_4$	99	351	123	103

- ② Can you always find m lines that cover all zeros?
- How can you find the m lines?

#### Answer

Claim: the algorithm never returns a previous assignment instance.

### Question

- Clearly, the algorithm introduces new zeros, but also removes some (the ones on the intersection of two lines). Can this algorithm cycle forever?
- ② Can you always find m lines that cover all zeros?

How can you find the m lines?

#### Answer

Claim: the algorithm never returns a previous assignment instance.

*Proof:* Let  $X = \sum_{i=1}^{n} \sum_{j=1}^{n} c_{i,j}$ .

The reducions will reduce X by  $d \times n^2$ . The additions will increase the current total by  $m \times n \times d$ . Since m < n the resulting total will be  $X - (n - m)n \times d < X$  hence a new equivalent instance of the previous assignment problem.

#### Definition

An alternating path is a sequence  $\{a_{r_1c_1}, a_{r_2c_2}, \ldots, a_{r_kc_k}\}$  of entries in the current assignment matrix such that:

#### Definition

The zeros on the path start with a non-selected zero and alternate between selected zeros and non-selected zeros.

#### Definition

If there is no selected zero on column number  $c_k$  then the path is an augmenting path.

Note that if we find an augmenting path, we can get a larger set of independent zeros by removing the independent zeros along the augmenting path and replacing them by the other zeros.

1. Once we find a set of independent zeros we can try to augment it. If we fail, we will be able to find a set of lines that covers all zeros whose size is equal to the number of independent zeros (that such a set of lines exists will be proved later).

1. Once we find a set of independent zeros we can try to augment it. If we fail, we will be able to find a set of lines that covers all zeros whose size is equal to the number of independent zeros (that such a set of lines exists will be proved later).

1. Once we find a set of independent zeros we can try to augment it. If we fail, we will be able to find a set of lines that covers all zeros whose size is equal to the number of independent zeros (that such a set of lines exists will be proved later).

2. Starting with a zero on a row with no independent zero (such a zero exists as every row contains zeros and there are only m < n independent zeros), we build an alternating path.

3
