AMath 483/583 — Lecture 12 — April 22, 2011	Notes:		
Today:			
LAPACK and BLAS			
Parallel computing concepts			
Monday:			
OpenMP			
Read: Class notes and references			
R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011		R.J. LeVeque, University of Washington	AMath 483/583, Lecture 12, April 22, 2011
The BLAS	Notes:		
Basic Linear Algebra Subroutines			
-			
Core routines used by LAPACK (Linear Algebra Package) and elsewhere.			
Generally optimized for particular machine architectures, cache hierarchy.			
Can create optimized BLAS using ATLAS (Automatically Tuned Linear Algebra Software)			
See notes and http://www.netlib.org/blas/faq.html			
<ul><li>Level 1: Scalar and vector operations</li><li>Level 2: Matrix-vector operations</li></ul>			
Level 3: Matrix-matrix operations			
·			
R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011		R.J. LeVeque, University of Washington	AMath 483/583, Lecture 12, April 22, 2011
The BLAS	Notes:		
Subroutine names start with:			
S: single precision			
D: double precision			
<ul><li>C: single precision complex</li><li>Z: double precision complex</li></ul>			
Examples:			
<ul> <li>DDOT: dot product of two vectors</li> <li>DGEMV: matrix-vector multiply, general matrices</li> </ul>			
<ul> <li>DGEMM: matrix-matrix multiply, general matrices</li> </ul>			
DSYMM: matrix-matrix multiply, symmetric matrices

Parallel processing	Notes:
Two major classes: Shared memory: All processors have access to the same memory. Multicore chip: separate L1 caches, L2 might be shared. Distributed memory: Each processor has it's own memory and caches. Transferring data between processors is slow. E.g., clusters of computers, supercomputers Hybrid: Often clusters of multicore machines!	
R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011	R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

Iulti-thread computing	Notes:		
For example, multi-threaded program on dual-core computer.			
r or example, mult-inteaded program on duar-core computer.			
Thread:			
A thread of control: program code, program counter, call stack, small amount of thread-specific data (registers, L1 cache).			
Shared memory and file system.			
Threads may be spawned and destroyed as computation proceeds.			
Languages like OpenMP.			
R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011		R.J. LeVeque, University of Washington	AMath 483/583, Lecture 12, April 22, 2011
OSIX Threads	Notes:		
Portable Operating System Intefrace			
Standardized C language threads programming interface			
For UNIX systems, this interface has been specified by the			
IEEE POSIX 1003.1c standard (1995).			
Implementations adhering to this standard are referred to as POSIX threads, or Pthreads.			
R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011		R.J. LeVeque, University of Washington	AMath 483/583, Lecture 12, April 22, 2011
ulti-thread computing	Notes:		
Some issues: Limited to modest number of cores when memory is shared.			
Multiple threads have access to same data — convenient and			
fast.			
Contention: But, need to make sure they don't conflict (e.g. two threads should not write to same location at same time).			
Dependencies, synchronization: Need to make sure some operations are done in proper order!			
May need cache coherence: If Thread 1 changes $x$ in its private cache, other threads might need to see changed value.			

A process is a thread that also has its own private address space. Multiple processes are often running on a single computer (e.g. different independent programs). For distributed memory parallel computers, a single computer (e.g. different independent programs). Larger cost in creating and destroying processes because of memory layout. Larger cost in creating and destroying processes. Greater latency in sharing data. Processes communicate by passing messages. Languages like MPI — Message Passing Interface. ## Amdahl's Law

Suppose 10% of the computation is inherently sequential, and the other 90% can be parallelized.

Question: How much faster could the computation potentially run on many processors?

Answer: At most a factor of 10, no matter how many processors.

The sequential part is taking 1/10 of the time and that time is still required even if the parallel part is reduced to zero time.

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

# Amdahl's Law

Suppose 1/S of the computation is inherently sequential, and the other (1 - 1/S) can be parallelized.

Then can gain at most a factor of S, no matter how many processors.

If  $T_S$  is the time required on a sequential machine and we run on *P* processors, then the time required will be (at least):

$$T_P = (1/S)T_S + (1 - 1/S)T_S/P$$

Note that

$$T_P 
ightarrow (1/S)T_S$$
 as  $P 
ightarrow \infty$ 

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

# Amdahl's Law

Suppose 1/S of the computation is inherently sequential  $\implies$ 

$$T_P = (1/S)T_S + (1 - 1/S)T_S/P$$

Example: If 5% of the computation is inherently sequential (S = 20), then the reduction in time is:

P	$T_P$
1	$T_S$
2	$0.525T_{S}$
4	$0.288T_{S}$
32	$0.080T_{S}$
128	$0.057T_{S}$
1024	$0.051T_{S}$

# Notes: R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011 Notes:

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011 Notes:

### Speedup

The ratio  $T_S/T_P$  of time on a sequential machine to time running in parallel is the speedup.

This is generally less than P for P processors. Perhaps much less.

Amdahl's Law plus overhead costs of starting processes/threads, communication, etc.

Caveat: May (rarely) see speedup greater than P... For example, if data doesn't all fit in one cache but does fit in the combined caches of multiple processors.

> R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

# Scaling

Some algorithms scale better than others as the number of processors increases.

Typically interested on how well algorithms work for large problems requiring lots of time, e.g.

Particle methods for n particles, algorithms for solving systems of n equations, algorithms for solving PDEs on  $n \times n \times n$  grid in 3D,

For large n, there may be lots of inherent parallelism.

But depends on many factors: dependencies between calculations, communication as well as flops, nature of problem and algorithm chosen.

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

# Scaling

Typically interested on how well algorithms work for large problems requiring lots of time.

Strong scaling: How does the algorithm perform as the number of processors P increases for a fixed problem size n?

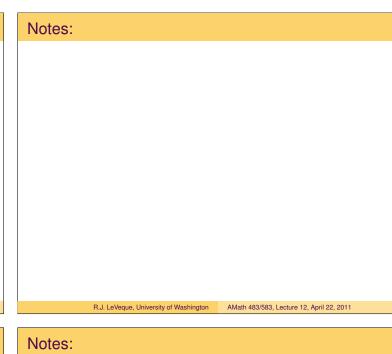

Any algorithm will eventually break down (consider P > n)

Weak scaling: How does the algorithm perform when the problem size increases with the number of processors?

E.g. If we double the number of processors can we solve a problem "twice as large" in the same time?

### Notes:

AMath 483/583, Lecture 12, April 22, 2011 R.J. LeVeque, University of Washington

### Weak scaling

What does "twice as large" mean?

Depends on how algorithm complexity scales with n.

**Example:** Solving linear system with Gaussian elimination requires  $O(n^3)$  flops.

Doubling n requires 8 times as many operations.

Problem is "twice as large" if we increase n by a factor of  $2^{1/3}\approx 1.26.$ 

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011

# Weak scaling

Solving steady state heat equation on  $n \times n \times n$  grid.

 $n^3$  grid points  $\implies$  linear system with this many unknowns.

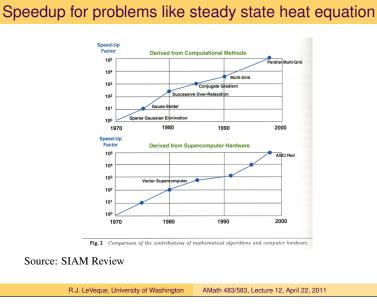

If we used Gaussian elimination (very bad idea!) we would require  $\sim (n^3)^3 = n^9$  flops.

Doubling n would require  $2^9 = 512$  times more flops.

Good iterative methods can do the job in  $O(n^3) \log_2(n)$  work or less. (e.g. multigrid).

Developing better algorithms is as important as better hardware!!

R.J. LeVeque, University of Washington AMath 483/583, Lecture 12, April 22, 2011
