

Note: This means characteristics must approach shock from both sides as t advances, not move away from shock!

## Approximate Riemann solvers

For nonlinear problems, computing the exact solution to each Riemann problem may not be possible, or too expensive.

Often the nonlinear problem  $q_t + f(q)_x = 0$  is approximated by

 $q_t + A_{i-1/2}q_x = 0, \qquad q_\ell = Q_{i-1}, \quad q_r = Q_i$ 

for some choice of  $A_{i-1/2} \approx f'(q)$  based on data  $Q_{i-1}, Q_i$ .

Solve linear system for  $\alpha_{i-1/2}$ :  $Q_i - Q_{i-1} = \sum_p \alpha_{i-1/2}^p r_{i-1/2}^p$ . Waves  $\mathcal{W}_{i-1/2}^p = \alpha_{i-1/2}^p r_{i-1/2}^p$  propagate with speeds  $s_{i-1/2}^p$ ,  $r_{i-1/2}^p$  are eigenvectors of  $A_{i-1/2}$ ,  $s_{i-1/2}^p$  are eigenvalues of  $A_{i-1/2}$ .

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 15.3.2]

# Approximate Riemann solvers

 $q_t + \hat{A}_{i-1/2}q_x = 0, \qquad q_\ell = Q_{i-1}, \quad q_r = Q_i$ Often  $\hat{A}_{i-1/2} = f'(Q_{i-1/2})$  for some choice of  $Q_{i-1/2}$ . In general  $\hat{A}_{i-1/2} = \hat{A}(q_\ell, q_r)$ .

Roe conditions for consistency and conservation:

- $\bullet \ \hat{A}(q_\ell,q_r) \to f'(q^*) \ \ \text{as} \ \ q_\ell,q_r \to q^*\text{,}$
- $\hat{A}$  diagonalizable with real eigenvalues,
- For conservation in wave-propagation form,

$$\hat{A}_{i-1/2}(Q_i - Q_{i-1}) = f(Q_i) - f(Q_{i-1}).$$

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 15.3.2]

### Approximate Riemann solvers

For a scalar problem, we can easily satisfy the Roe condition

$$\hat{A}_{i-1/2}(Q_i - Q_{i-1}) = f(Q_i) - f(Q_{i-1})$$

by choosing

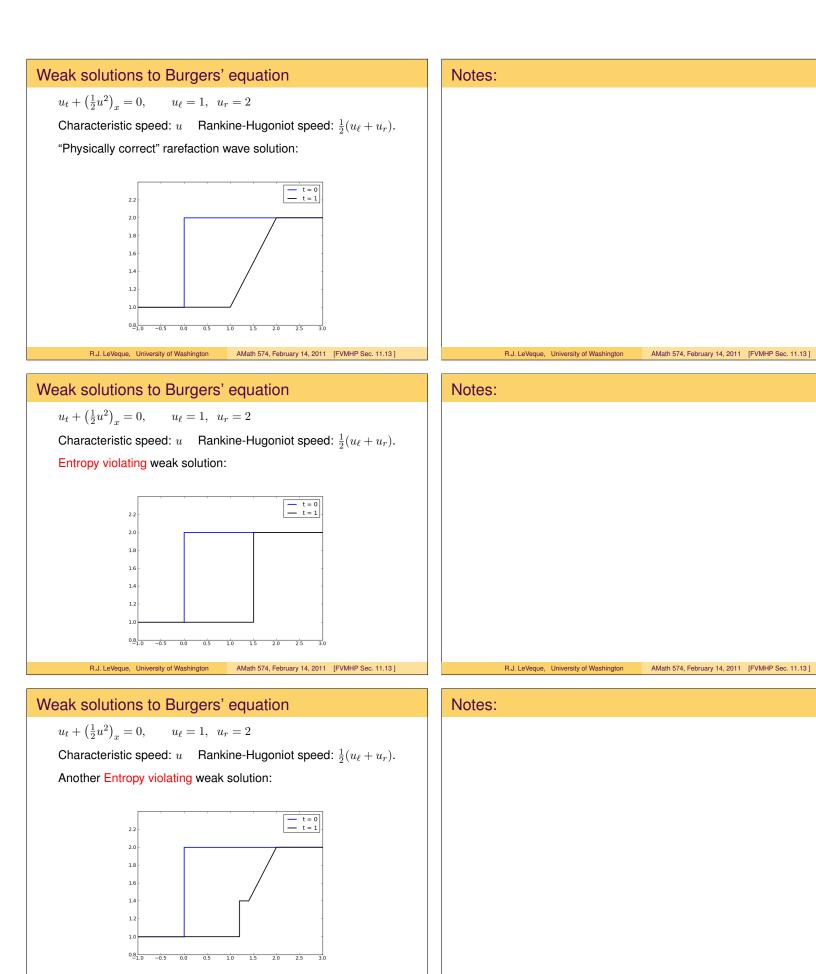

$$\hat{A}_{i-1/2} = \frac{f(Q_i) - f(Q_{i-1})}{Q_i - Q_{i-1}}$$

Then  $r_{i-1/2}^1 = 1$  and  $s_{i-1/2}^1 = \hat{A}_{i-1/2}$  (scalar!).

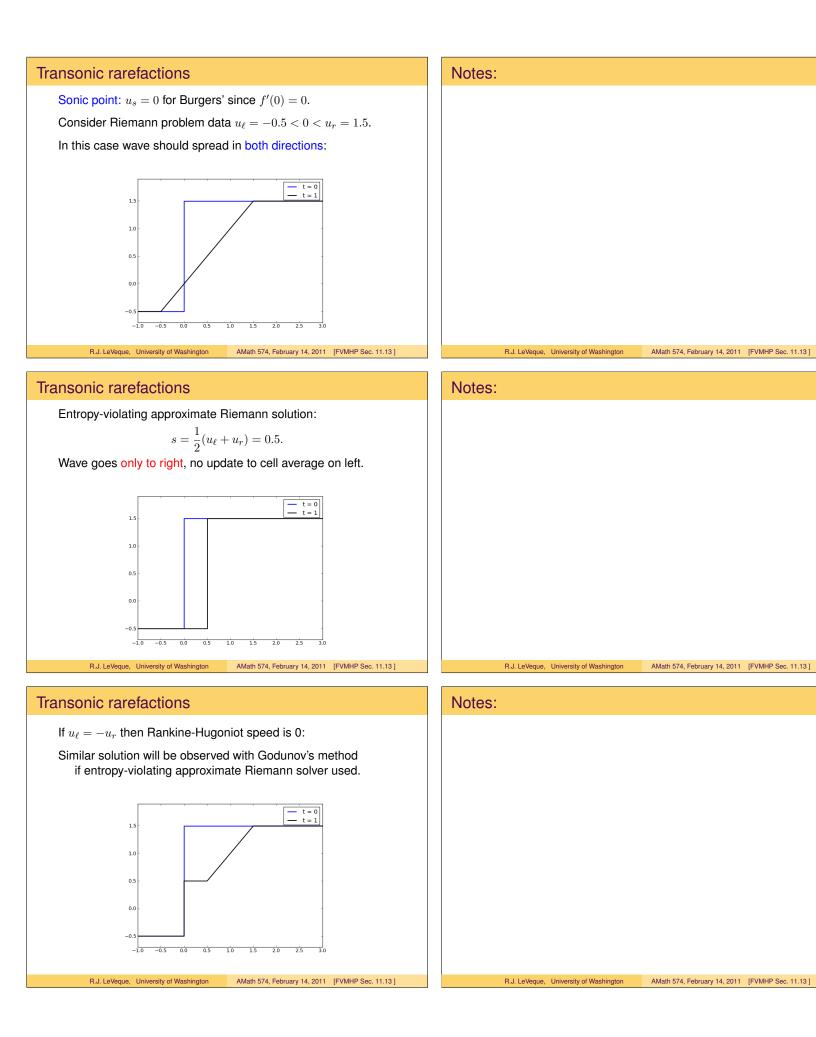

Note: This is the Rankine-Hugoniot shock speed.

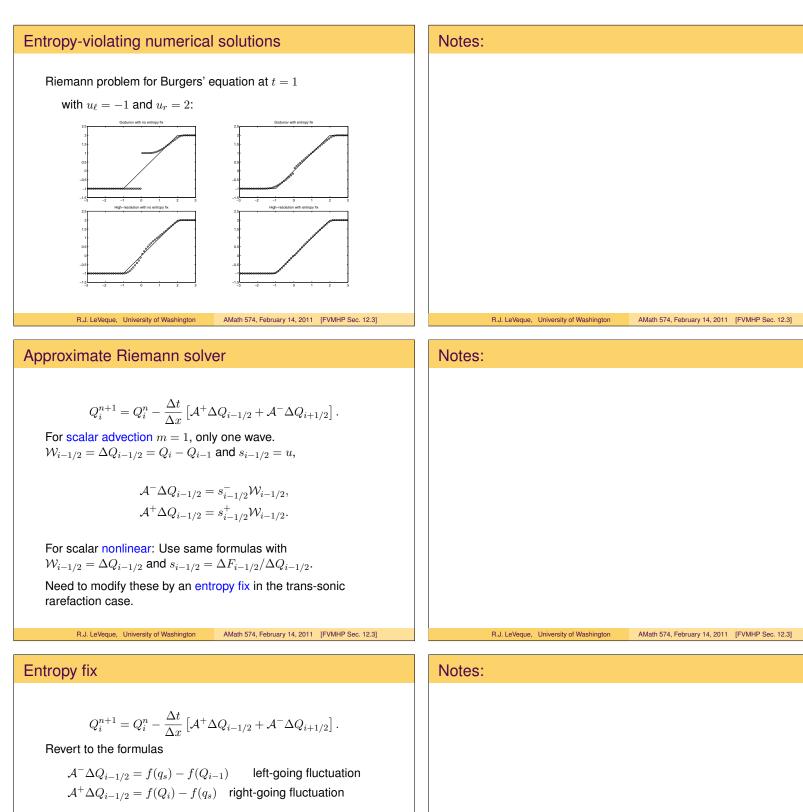

⇒ shock waves are correct, rarefactions replaced by entropy-violating shocks. Notes: R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 15.32]

if  $f'(Q_{i-1}) < 0 < f'(Q_i)$ .

High-resolution method: still define wave W and speed s by

 $\mathcal{W}_{i-1/2} = Q_i - Q_{i-1},$  $s_{i-1/2} = \begin{cases} (f(Q_i) - f(Q_{i-1}))/(Q_i - Q_{i-1}) & \text{if } Q_{i-1} \neq Q_i \\ f'(Q_i) & \text{if } Q_{i-1} = Q_i. \end{cases}$

### **Entropy functions**

A scalar-valued function  $\eta : \mathbb{R}^m \to \mathbb{R}$  is a convex function of qif the Hessian matrix  $\eta''(q)$  with (i, j) element

$$\eta_{ij}''(q) = \frac{\partial^2 \eta}{\partial q^i \partial q^j}$$

is positive definite for all q, i.e., satisfies

$$v^T \eta''(q) v > 0$$
 for all  $q, v \in \mathbb{R}^m$ .

Scalar case: reduces to  $\eta''(q) > 0$ .

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4]

# **Entropy functions**

Entropy function:  $\eta : \mathbb{R}^m \to \mathbb{R}$  Entropy flux:  $\psi : \mathbb{R}^m \to \mathbb{R}$ 

chosen so that  $\eta(q)$  is convex and:

•  $\eta(q)$  is conserved wherever the solution is smooth,

 $\eta(q)_t + \psi(q)_x = 0.$ 

• Entropy decreases across an admissible shock wave.

### Weak form:

$$\int_{x_1}^{x_2} \eta(q(x,t_2)) \, dx \leq \int_{x_1}^{x_2} \eta(q(x,t_1)) \, dx \\ + \int_{t_1}^{t_2} \psi(q(x_1,t)) \, dt - \int_{t_1}^{t_2} \psi(q(x_2,t)) \, dt$$

with equality where solution is smooth.

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4]

## **Entropy functions**

How to find  $\eta$  and  $\psi$  satisfying this?

$$\eta(q)_t + \psi(q)_x = 0$$

For smooth solutions gives

$$\eta'(q)q_t + \psi'(q)q_x = 0.$$

Since  $q_t = -f'(q)q_x$  this is satisfied provided

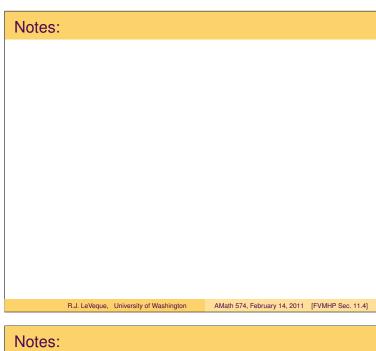

$$\psi'(q) = \eta'(q)f'(q)$$

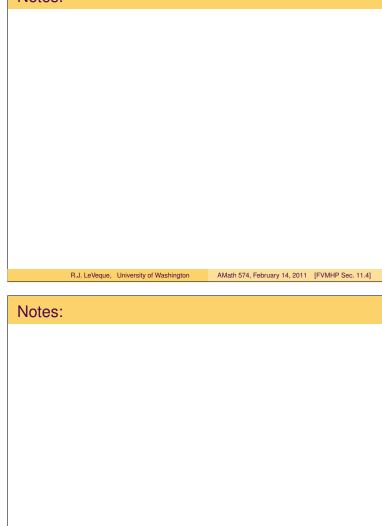

Scalar: Can choose any convex  $\eta(q)$  and integrate.

**Example:** Burgers' equation, f'(u) = u and take  $\eta(u) = u^2$ .

Then  $\psi'(u) = 2u^2 \implies$  Entropy function:  $\psi(u) = \frac{2}{3}u^3$ .

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4]

# Weak solutions and entropy functions

The conservation laws

$$u_t + \left(\frac{1}{2}u^2\right)_x = 0$$
 and  $(u^2)_t + \left(\frac{2}{3}u^3\right)_x = 0$ 

both have the same quasilinear form

 $u_t + uu_x = 0$ 

but have different weak solutions, different shock speeds!

Entropy function:  $\eta(u) = u^2$ .

A correct Burgers' shock at speed  $s=\frac{1}{2}(u_\ell+u_r)$  will have total mass of  $\eta(u)$  decreasing.

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4]

# **Entropy functions**

$$\int_{x_1}^{x_2} \eta(q(x,t_2)) \, dx \leq \int_{x_1}^{x_2} \eta(q(x,t_1)) \, dx + \int_{t_1}^{t_2} \psi(q(x_1,t)) \, dt - \int_{t_1}^{t_2} \psi(q(x_2,t)) \, dt$$

comes from considering the vanishing viscosity solution:

$$q_t^{\epsilon} + f(q^{\epsilon})_x = \epsilon q_{xx}^{\epsilon}$$

Multiply by  $\eta'(q^{\epsilon})$  to obtain:

$$\eta(q^{\epsilon})_t + \psi(q^{\epsilon})_x = \epsilon \eta'(q^{\epsilon}) q_{xx}^{\epsilon}.$$

Manipulate further to get

$$\eta(q^{\epsilon})_t + \psi(q^{\epsilon})_x = \epsilon \left(\eta'(q^{\epsilon})q_x^{\epsilon}\right)_x - \epsilon \eta''(q^{\epsilon}) (q_x^{\epsilon})^2.$$

R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4]

# **Entropy functions**

Smooth solution to viscous equation satisfies

$$\eta(q^{\epsilon})_t + \psi(q^{\epsilon})_x = \epsilon \left(\eta'(q^{\epsilon})q_x^{\epsilon}\right)_x - \epsilon \eta''(q^{\epsilon}) (q_x^{\epsilon})^2.$$

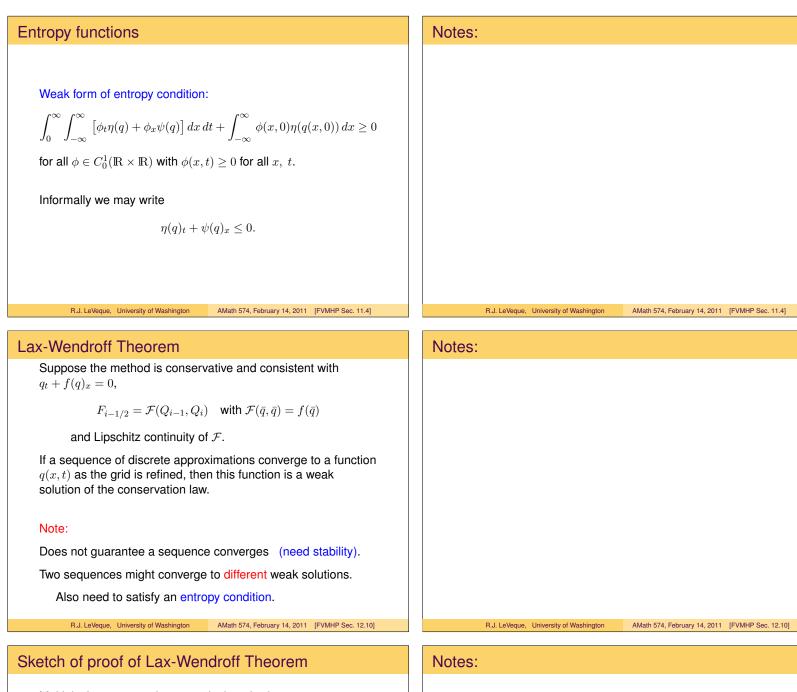

Integrating over rectangle  $[x_1, x_2] \times [t_1, t_2]$  gives

$$\begin{split} \int_{x_1}^{x_2} & \eta(q^{\epsilon}(x,t_2)) \, dx = \int_{x_1}^{x_2} \eta(q^{\epsilon}(x,t_1)) \, dx \\ & - \left( \int_{t_1}^{t_2} \, \psi(q^{\epsilon}(x_2,t)) \, dt - \int_{t_1}^{t_2} \, \psi(q^{\epsilon}(x_1,t)) \, dt \right) \\ & + \epsilon \int_{t_1}^{t_2} \, \left[ \eta'(q^{\epsilon}(x_2,t)) \, q^{\epsilon}_x(x_2,t) - \eta'(q^{\epsilon}(x_1,t)) \, q^{\epsilon}_x(x_1,t) \right] \, dt \\ & - \epsilon \int_{t_1}^{t_2} \, \int_{x_1}^{x_2} \, \eta''(q^{\epsilon}) \, (q^{\epsilon}_x)^2 \, dx \, dt. \end{split}$$

 $\label{eq:linear} \begin{array}{l} \mbox{Let $\epsilon$} \to 0 \mbox{ to get result:} \\ \mbox{Term on third line goes to 0,} \\ \mbox{Term of fourth line is always} \leq 0. \\ \\ \mbox{R.J. LeVeque, University of Washington} \\ \end{array} \qquad \mbox{AMath 574, February 14, 2011 [FVMHP Sec. 11.4]} \end{array}$

# R.J. LeVeque, University of Washington AMath 574, February 14, 2011 [FVMHP Sec. 11.4] Notes: R.J. LeVeque, University of Washington

Multiply the conservative numerical method

$$Q_i^{n+1} = Q_i^n - \frac{\Delta t}{\Delta x} (F_{i+1/2}^n - F_{i-1/2}^n)$$

by  $\Phi_i^n$  to obtain

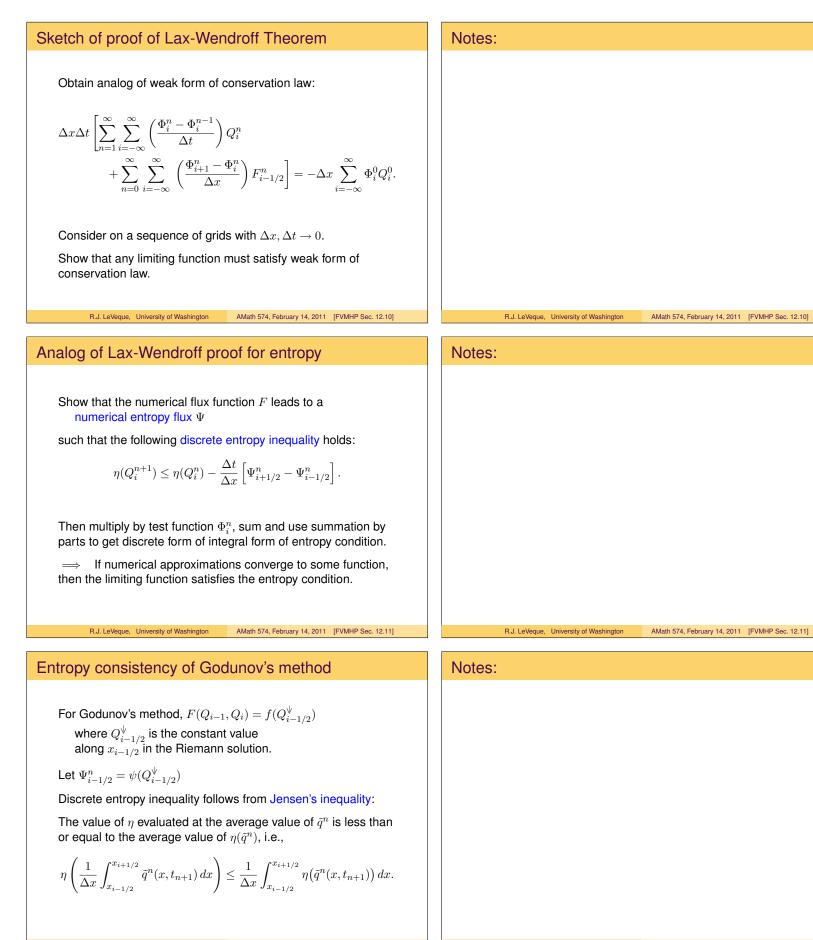

$$\Phi_i^n Q_i^{n+1} = \Phi_i^n Q_i^n - \frac{\Delta t}{\Delta x} \Phi_i^n (F_{i+1/2}^n - F_{i-1/2}^n).$$

This is true for all values of i and n on each grid. Now sum over all i and  $n \ge 0$  to obtain

$$\sum_{n=0}^{\infty} \sum_{i=-\infty}^{\infty} \Phi_i^n (Q_i^{n+1} - Q_i^n) = -\frac{\Delta t}{\Delta x} \sum_{n=0}^{\infty} \sum_{i=-\infty}^{\infty} \Phi_i^n (F_{i+1/2}^n - F_{i-1/2}^n).$$

Use summation by parts to transfer differences to  $\Phi$  terms.
