

Key

Score 102: Quiz 4

There are two sides to this quiz. You can use a calculator and a 5-sided 3×5 " notecard with anything written or typed on it.

1. [4] (10/30 Discussion) Critique the following "definition" of science: "Science is the study of the structure and behavior of the physical and natural world".

start (+5)

reasonable
points made (+1)

Sense (+1)

comparable to other
disciplines (+5)

(+1)

This definition might equally apply to someone's religion.
In particular Greek mythology often had this characteristic
of trying to understand & explain the structure & behavior
of the physical and natural world.

[This definition is missing the scientific method - the
methods used in the study. This would include
falsifiable statements, repeatability, "good experiments" ^{in the TED talk}, etc]

2. [3] (11/1 Lecture) Describe some of the ways that Origami was used and taught when first created.

start (+5)

true (+1)

related to origami (+1)

sense (+5)

Initially Origami was used for formal occasions since paper
was scarce. The patterns developed were dogmatic that
is people were not encouraged to personalize or experiment
with designs. Common locations to use Origami was weddings.

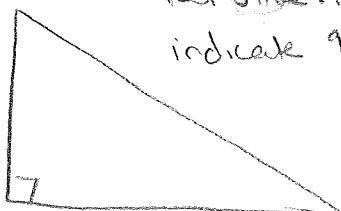

The patterns were also generally not written down but passed on
through a verbal tradition.

3. [4] Draw an example for each of the following:

(a) Right triangle

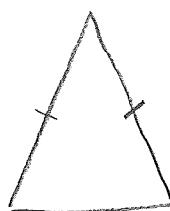

(b) Isosceles triangle

(a)

a right Δ has
one 90° angle

(b)

an isosceles Δ
has two sides that
are the same length.

(or equivalently, two angles)
(that have the same measure)

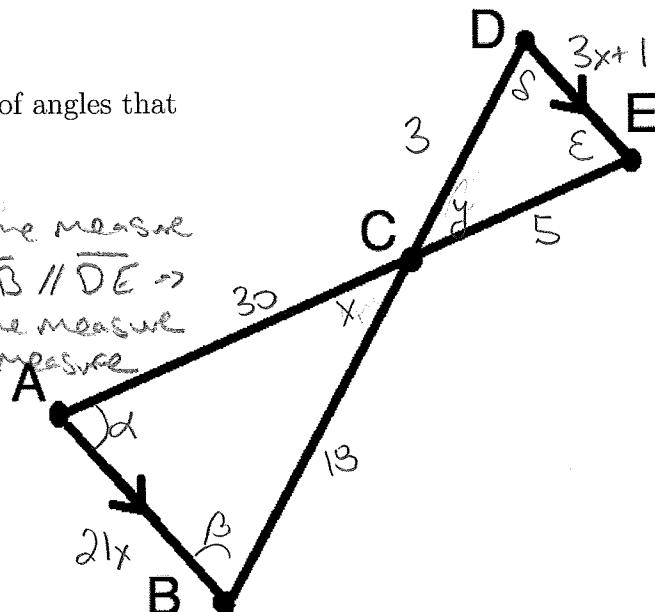

4. For the following questions consider the figure shown on the right.
 Note that \overline{AB} is parallel to \overline{DE} .

- (a) [2] (Wheater §7.3) Identify a pair of angles that have the same measures.

Vertical angles $\Rightarrow \angle A$ & $\angle E$
 $\angle A$ & $\angle E$ have the same measure
 All interior angles and $\overline{AB} \parallel \overline{DE} \Rightarrow$
 $\angle D$ & $\angle B$ have the same measure
 $\angle C$ & $\angle F$ have the same measure

- (b) [1] Identify what kind of triangle $\triangle ABC$ is (acute? obtuse? right?).

Acute

- (c) [3] (Wheater §7.4) Given that:

$$\begin{aligned}\overline{AB} &= 21x, \overline{AC} = 30, \\ \overline{CE} &= 5, \overline{DE} = 3x + 1, \\ \overline{CB} &= 18, \overline{DC} = 3.\end{aligned}$$

Set up a true equation involving x that will allow you to solve for x .

$$\textcircled{+s} \quad \left[\frac{\overline{AB}}{\overline{AC}} = \frac{\overline{ED}}{\overline{EC}} \right]$$

$$\textcircled{+t} \quad \left[\frac{21x}{30} = \frac{3x+1}{5} \right]$$

- (d) [2] Find x from problem b above.

looking for similar triangles $\textcircled{+s}$
 note by (a)
 $\triangle ABC \sim \triangle EDC$ $\textcircled{+t}$
 so ratios of side lengths are equal

OR

$$\frac{\overline{AB}}{\overline{BC}} = \frac{\overline{ED}}{\overline{DC}}$$

Note: There are lots of equations that could be used.

$$\frac{21x}{18} = \frac{3x+1}{3}$$

↓

$$21x \cdot 5 = 30(3x+1)$$

OR

$$21x \cdot 3 = 18(3x+1)$$

$$B \cdot 7 \cdot 5x = B \cdot 2 \cdot 5(3x+1)$$

$$B \cdot 7 \cdot 3 \cdot x = B \cdot 3 \cdot 2(3x+1)$$

$$\begin{aligned}7x &= 10x + 2 \\ -6x &\quad -6x \\ \hline x &= 2\end{aligned}$$

2

$$\begin{aligned}7x &= 10x + 2 \\ -6x &\quad -6x \\ \hline x &= 2\end{aligned}$$

Start $\textcircled{+s}$
 Pairs of angles $\textcircled{+s}$
 got it $\textcircled{+t}$

\triangle type $\textcircled{+s}$
 got it $\textcircled{+s}$

Start $\textcircled{+s}$
 Factors $\textcircled{+s}$
 order up $\textcircled{+t}$
