

tc core 122: Midterm

Key

1. True/False: If true, explain briefly why the statement is true. If false, provide an example that contradicts the statement.

(a) [2] (Wheater §1.4) Given the statements "If I eat a big lunch, then I get sleepy in the afternoon." and "I took an afternoon nap.", we can conclude that "I ate a big lunch".

start +.5
false +.5
reasoning +1

False. The logic would be analogous to the following:
Since "If I'm good at everything, then I'm good at math."
"I'm good at math".

thus "I'm good at everything" This faulty logic comes from mixing up a conditional statement with the converse.

(b) [2] (Wks #1) If A and α are vertical angles, then $A \cong \alpha$.

start +.5
true +.5
reasoning +1

True. This was discovered in worksheet 1 by comparing the 2 angles directly. The result was also presented in Ch1 of Wheeler.

We can also prove the result:
 ~~$A \cong B$~~ ~~$\alpha \cong \alpha$~~ Since $B + \alpha = 180^\circ = A + B$ we can subtract B from both sides

(c) [2] (Quiz3 #1) If A and α are corresponding angles, then $A \cong \alpha$.

start +.5
false +.5
reasoning +1

False. Consider lines l and m with a line t transversing them. Note that A and α are corresponding but $A \neq \alpha$.

(d) [2] (Week 3) The origami pattern I presented did not use a base. (Please specify which origami pattern you presented!) F Frog used the frog base (also preliminary)

start +.5
pattern presented +.5
correct +.5
name base that exists +.5

- F penguin used the fish base
- T Samurai did not use a base lol didn't know
- F Crane used the bird base (also the preliminary)
- F Lily used the frog base (also the preliminary)
- F Balloon used the water bomb base

2. [2] (Quiz1 #5) Lang claimed you can let "dead people do you work for you." What particular results from dead people was Lang interested in and how did it help with the design of new origami shapes?

understand +.5
+1

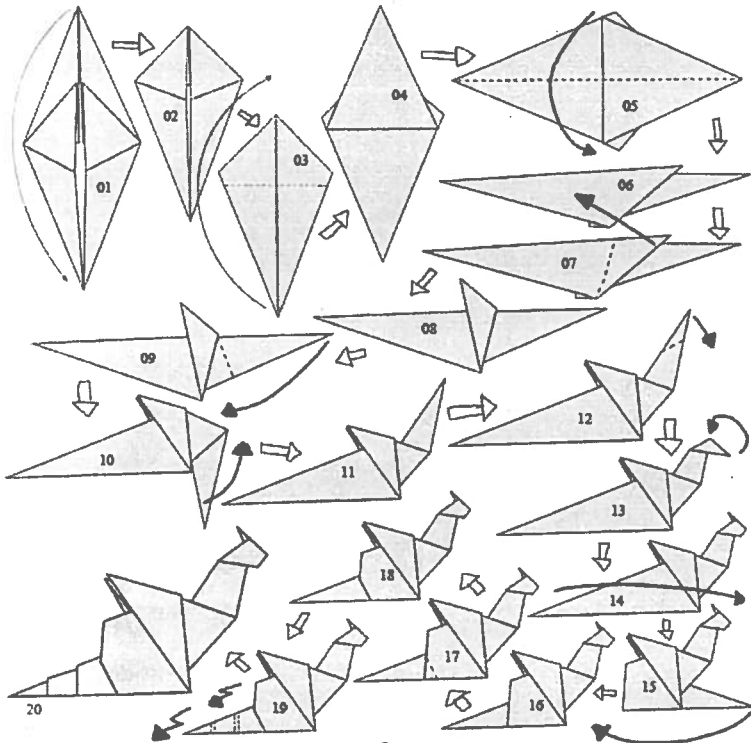

Packing circles

In order to make/reserve space for a flap when designing an origami piece one needs to make/reserve a circle on the paper. So to create a piece with multiple flaps corresponds to arranging packing circles.

3. [3] (Lang) Identify what the origami symbols below mean.

4. [4] (Lecture 4/25) Identify the base each of the origami directions below make use of.

Fish base (Step 1)

F.W.'s Origami Wombat

Crease the paper along the middle. Fold the top and bottom edges in to meet the crease.

Crease the shape up the middle. Fold all the corners over crossing them, and then unfold them again.

Bring the corners down while holding corners in to make sharp lines. This will create four new points that meet in the middle.

Flip the shape over so that you are looking at the smooth side.

I fold the shape along the middle so that you bring the bottom edge up to meet the top edge.

This is the body of the wombat. I have it done to give it some legs!

I fold the triangles that meet in the middle down so that they now extend down past the bottom of the body.

On one end of the wombat fold the point up for the nose. On the other end fold the point in.

Now fold the nose over one more time. Then use the marker to color it in and to add eyes and a smile.

Cupboard (Step 1 & 2)

5. [5] (viHart video 4/2) Explain carefully how to make a 22.5° "angle-a-tron" in a Patty Paper worksheet setting. That is, explain how you can build an angle of 22.5° using only ~~paper~~ paper, a pencil, your sense, and logic.

started (+5) working toward method (+5)

Notice that patty paper is square so the corner forms 90°

intuition (+1) near precise (+1) removed (+1) works understandable (+1)

Steps:

1) Fold over the corner so adjacent sides line up + unfold. Note: we've created a 45° "angle-a-tron".

2) Fold the bottom edge of the paper up to the new crease created in step 1.

Notice our paper looks like:

Both α and β have measure

$22.5^\circ = \frac{45^\circ}{2}$ and can be our "angle-a-tron"

6. [4] (Quiz3 #3) Explain the difference between how Pythagorus thought/worked with numbers and how people today think/work with numbers.

understand (1)
ontology (1)
true (1)
sense (1)

Pythagorus didn't 'think of numbers on a number line'
The number 2 was no more closer to 3 than it was to 30.

Pythagorus also didn't know about algebra (& thus couldn't always 'solve' for a number in the same way we do).

7. (Technical Communication Today) Richard Johnson-Sheehan gave a long list of suggestions to authors of instruction sets.

(a) [1] Identify one of his suggestions that you use well.

3) sense
at pattern
reading

List of possible suggestions

- 1) order steps sequentially
- 2) use command voice
- 3) put only 1 action per step

- 4) Number the steps
- 5) add comments, notes & examples
- 6) provide feedback
- 7) refer to graphics

(b) [1] Identify one of his suggestions that you think if you used this suggestion, it would improve your write-ups for the worksheets.

same list of possible suggestions

8. [2] (Mathematician's Lament) What is Paul Lockhart's thesis/point in "A Mathematician's Lament"?

reading (1)
thesis (1)

Mathematics is an art in the same way that music and painting are arts but it is rarely (if ever) presented in this way. Instead math is presented as dead, a skill to practice (like scales in music or paint by number in painting) and students are not encourage to investigate & create with it.

9. [3] (Between the Folds) There is a "Great Debate" amongst those who fold origami about the whether the recent, more technical, folding techniques developed constitute art. Explain your position.

start (1.5)
state position (1)
reason/understand (1.5)
reason (1)

technical folding is art

- allows for more variety of creative pieces
- analogous to technical scales made by musicians that were later incorporated into new music

technical folding is not art.

- art should not be repeatable
- art should have emotion of some kind in it.

10. Consider the diagram on the right.
Show your work and find:

(a) [1] a pair of alternating exterior angles.

Thinking of A and C as transversals
randomly
B and D as transversals

(b) [1] the measure of $\angle E$,
 $B \cong 44^\circ$

$e = 180 - 44 = 136^\circ$

(c) [2] the measure of $\angle F$,

$C \cong 44^\circ$ and $D \cong 70^\circ$

Since the sum of angles in a Δ is 180

$f = 180 - 44 - 70 = 66^\circ$

(d) [1] a pair of similar triangles,

ΔCDF is similar to the large ΔAGF

(e) [2] the measure of side x .

Since the Δ 's described in (d) are similar we know

$\frac{CF}{AF} = \frac{3.5}{x}$
 $\frac{1}{2} = \frac{3.5}{x}$

$x = 2 \cdot 3.5 = x = 7$

Note: you can use party paper to trace the angles and confirm the answers are what are reported on the left

We'll show ΔCDF is similar to ΔAGF with geometric/algebraic rules

Create a dashed line \parallel to l
Create a dotted line \parallel to s
Since line t transverses the 2 \parallel lines $f \cong t$ (corresponding angles)

Since line t transverses the 2 \parallel lines s and dotted, $f \cong t$ (corresponding angles)
We can copy the side lengths & obtain 2 copies of the line ΔCDF
b/c of placement see the Δ 's ΔCDF and ΔAGF have the same angles

11. [10] Consider a standard 8.5" by 11" sheet of notebook paper. Identify the lower right hand corner of these piece of paper with a point/label A . Define the Turned-Up Part, (or TUP) as the part of the back side of the paper that becomes exposed when folding point A to meet another point B (that may or may not be on the paper).

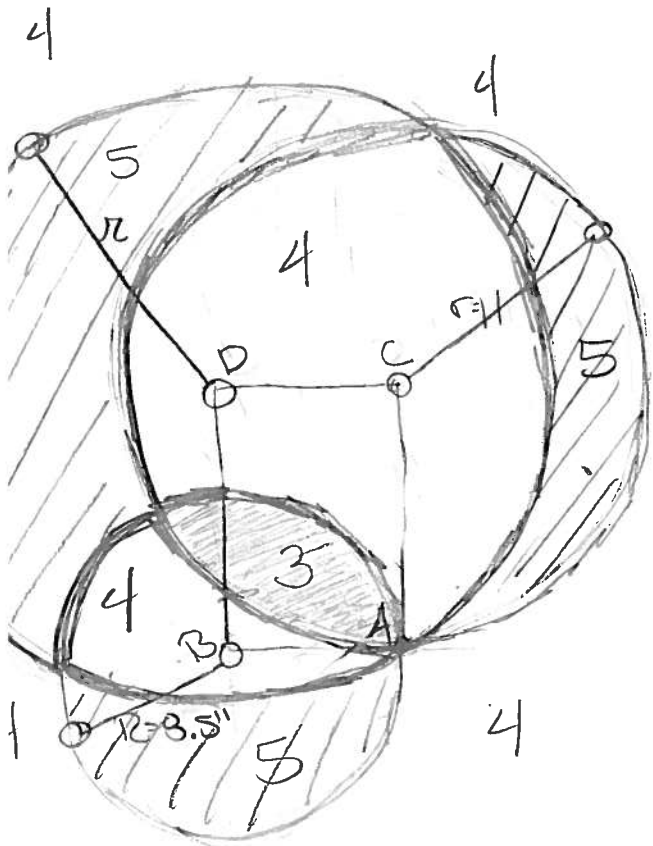

Find an answer to the question "How can we tell how many edges a TUP will have before we fold the paper?"

Treat this is as a patty paper exercise so use paper(s), a pencil, and a calculator.

(13) Clarity and precision/label +1
 sense 1
 precise/notebook 1

(+7) Reasoning actively trying things +1.5
 bidding diff of past failures +1.5
 bidding diff of class knowledge +1.5
 justification +1.5
 Consider all cases (off paper too) 1

Process 5.5 Explanation 4.5 Correctness 0

Regions are created by drawing three circles with centers $B, C + D$ and lengths $8.5, 11$ and $\sqrt{8.5^2 + 11^2}$ respectively (corresponding to their respective distances from A).

If A is placed in the darkest shaded region the TUP will have 3 sides.

If A is placed in an unshaded region the TUP will have 4 sides.

If A is placed in a half shaded region (\parallel) then the TUP will have 5 sides.
