

Modular Arithmetic

Definition 1. If a and b are integers with $a \neq 0$, we say that a divides b if there is an integer c such that $b = ac$, or equivalently, if $\frac{b}{a}$ is an integer.

When a divides b we say that a is a factor or divisor of b , and that b is a multiple of a .

The notation $a|b$ denotes that a divides b . We write $a \nmid b$ when a does not divide b .

1. Does $3|7$?
2. Does $4|3214$?
3. Use quantifiers to write the definition of $a|b$.
4. Let n and d be positive integers. How many positive integers not exceeding n are divisible by d ?
5. Prove the following: Let a , b , and c be integers where $a \neq 0$. If $a|b$ and $a|c$, then $a|(b + c)$.

Check your answers by consulting page 238.

Definition 2. If a and b are integers and m is a positive integer, then a is congruent to b modulo m if m divides $a - b$.

We use the notation $a \equiv b \pmod{m}$ to indicate that a is congruent to b modulo m .

We say that $a \equiv b \pmod{m}$ is a congruence and that m is its modulus (*plural moduli*).

If a and b are not congruent modulo m we write $a \not\equiv b \pmod{m}$.

6. Is $17 \equiv 5 \pmod{6}$?

7. Is $24 \equiv 14 \pmod{6}$?

Definition 3. The set of all integers congruent to an integer a modulo m is called the congruence class of a modulo m .

8. Write down four distinct integers in the congruence class of 5 modulo 6.

9. Find $13 \pmod{3}$

10. Find $-97 \pmod{11}$
