Lattice QCD: successes, challenges & future outlook

Stephen R. Sharpe
University of Washington

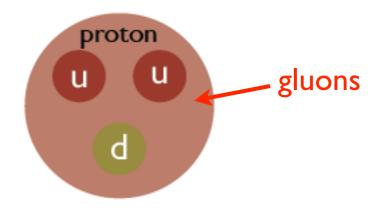

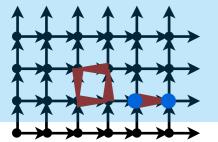

U. Adelaide colloquium, Feb. 15, 2019

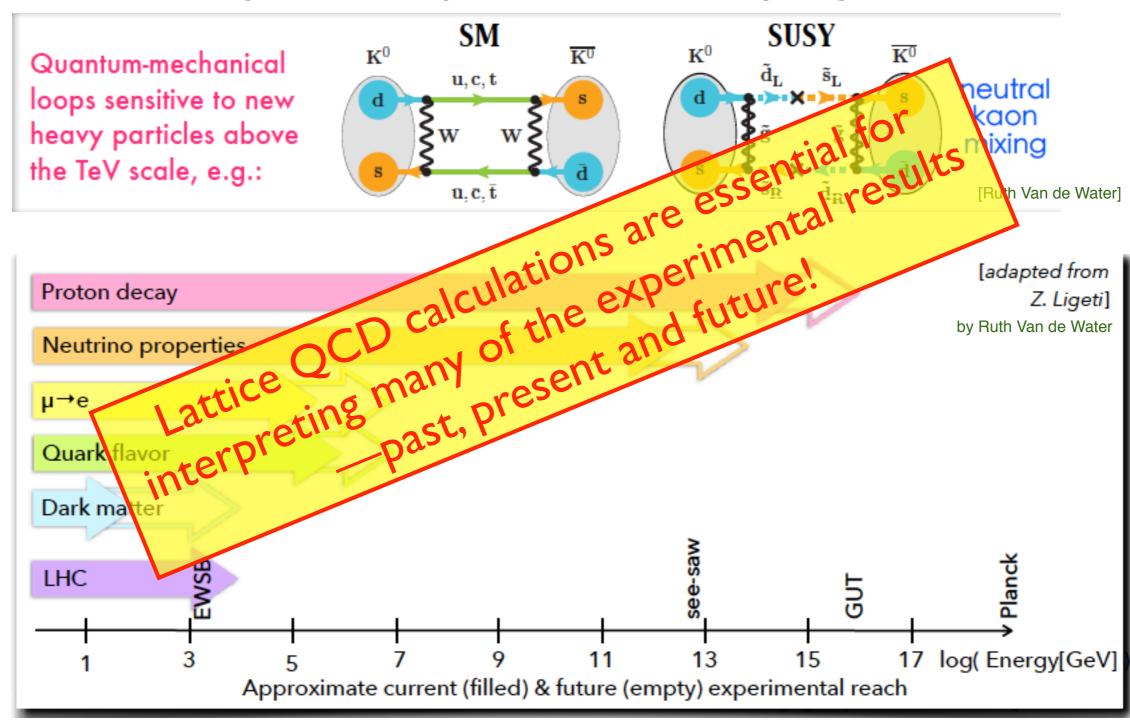

- Quantum ChromoDynamics is a peculiar theory
 - Quarks are absolutely confined
 - Quark properties are obscured

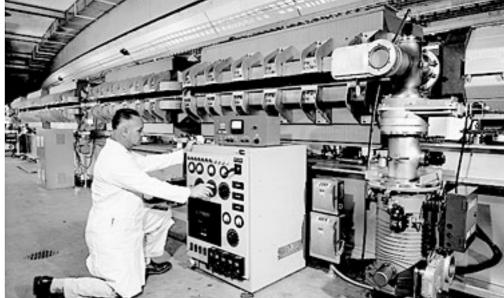

- QCD is a "background" in search for new physics
 - Must understand "old physics" of the standard model (SM) to find "new physics"
 - True both at "energy frontier" (LHC) and at "intensity frontier" (rare decays)
- QCD is strongly coupled, non-perturbative
- Lattice QCD is now a mature method that allows us to make precise predictions of properties of QCD

Intensity frontier probes extremely high scales

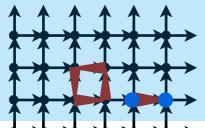

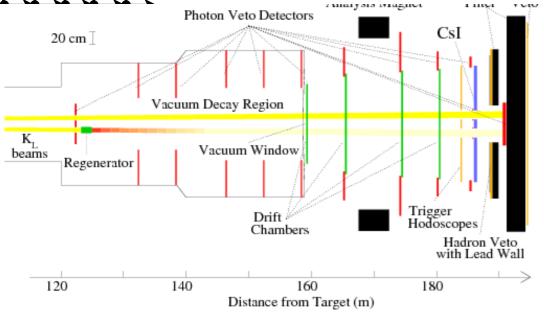

AGS @ BNL (E=33 GeV/c² protons)

• In 1961, Fitch and others measured the K_L - K_S mass difference: $\Delta M \approx 3.5 \cdot 10^{-12}$ GeV

We still do not know whether this result is consistent with the SM!

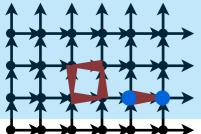

KTeV @ Fermilab: arXiv:0805.003 I

NA48 @ CERN: Cern website

In 1999, KTeV & NA48 measured CP violation in K→ππ decays [ε'/ε=1.63(26) 10-3]

We still do not know whether this result is consistent with the SM!

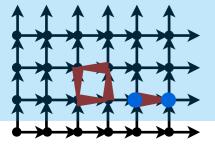

Fermilab website

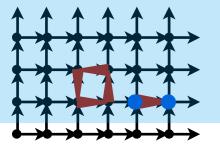

- Fermilab's muon g-2 experiment will have first results soon
 - Will reduce error by a factor of ~5

We want to know whether the result obtained is consistent with the SM!

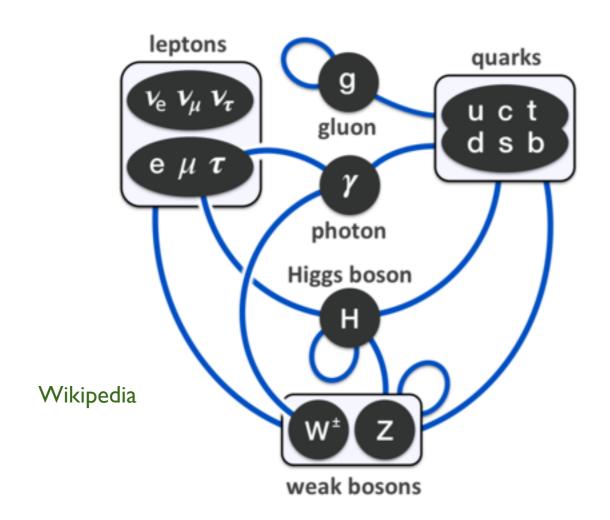

Outline

- High precision lattice QCD
- Constraining the Standard Model with LQCD
- Extending the LQCD frontier
- Future outlook

Standard Model (SM)

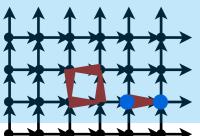

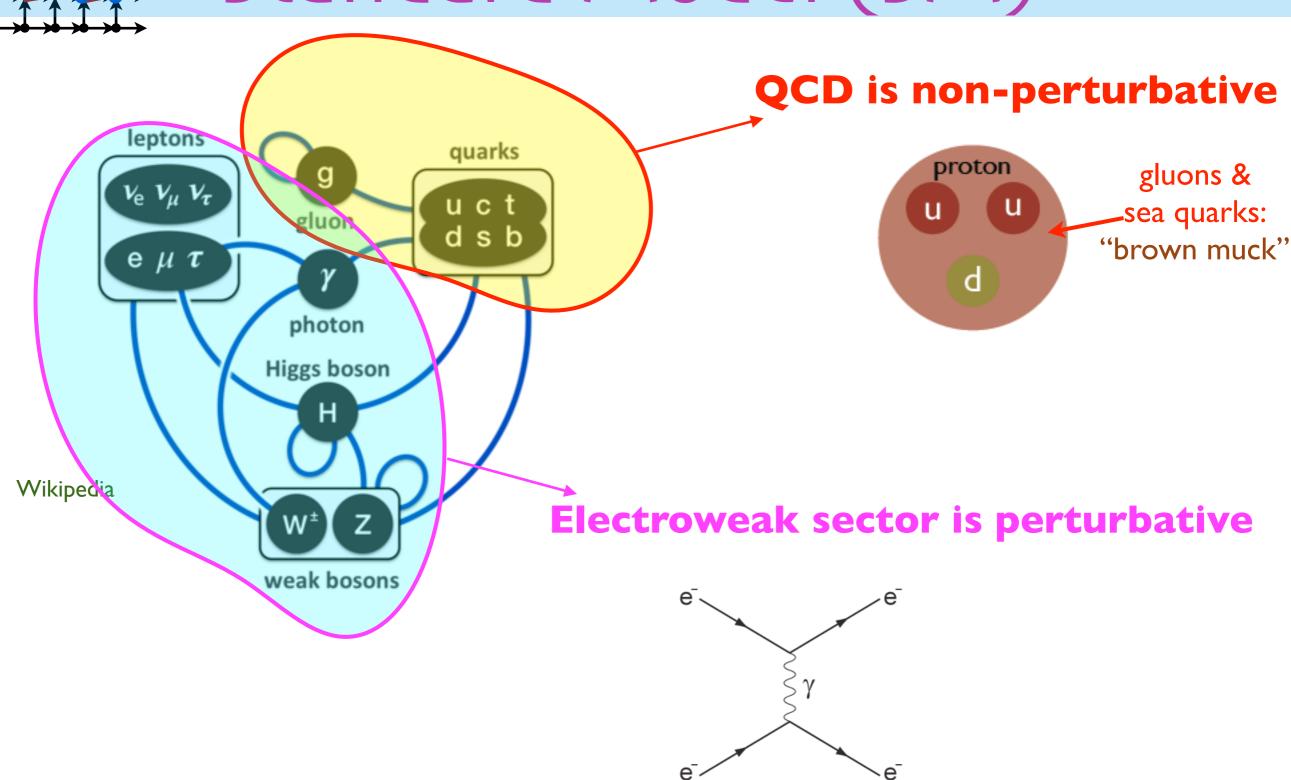

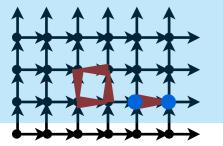

Standard Model (SM)

SM is extremely successful

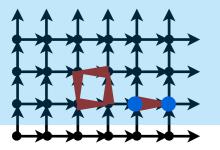

EM sector tested to extraordinary precision

$$4\pi/e^2 = \alpha^{-1} = 137.035\,999\,084(55)$$
 Electron g-2, 2008
$$4\pi/e^2 = \alpha^{-1} = 137.035\,998\,78(91)$$
 Rb, 2006

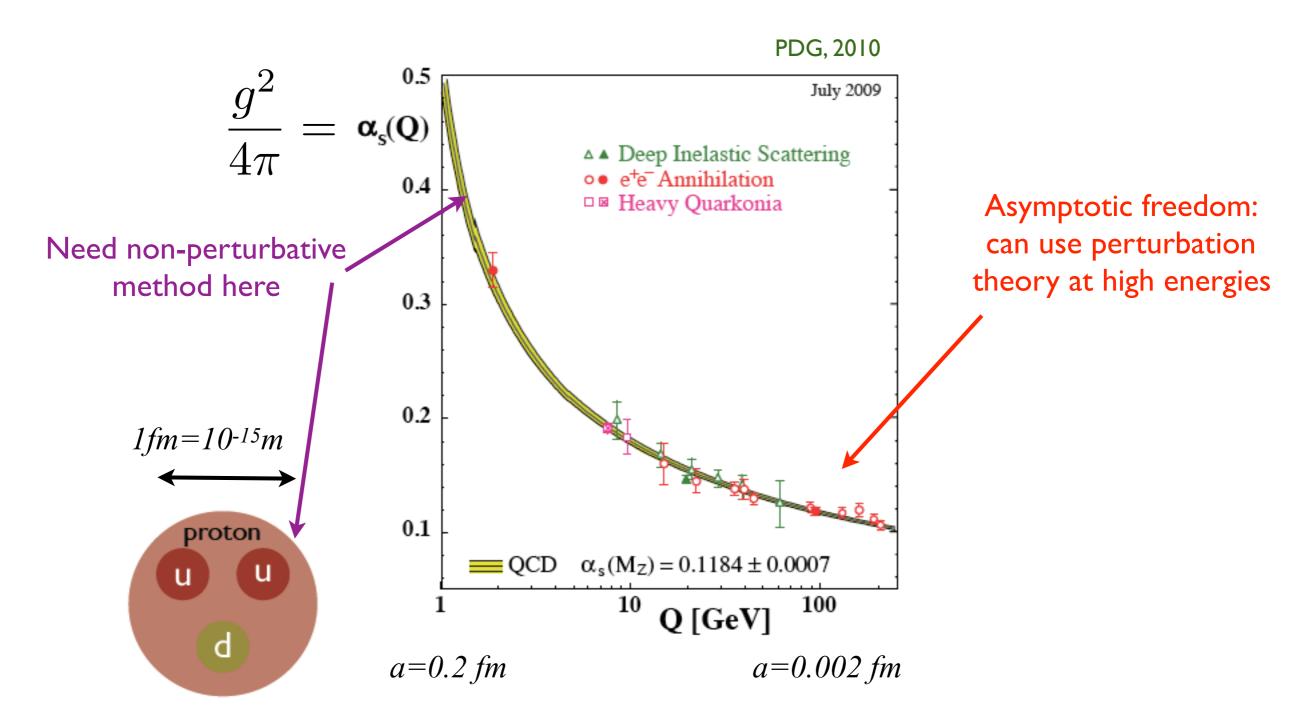

Weak sector tested to few parts in 1000

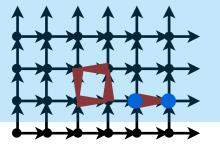

This is possible because couplings are weak enough to use perturbation theory

$$g_e - 2 = \frac{\alpha}{\pi} + C_2 \left(\frac{\alpha}{\pi}\right)^2 + C_3 \left(\frac{\alpha}{\pi}\right)^3 + C_4 \left(\frac{\alpha}{\pi}\right)^4 + C_5 \left(\frac{\alpha}{\pi}\right)^5 + \dots$$

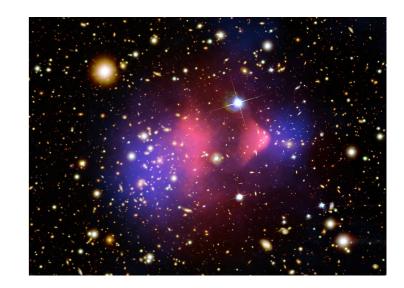

QCD is more challenging

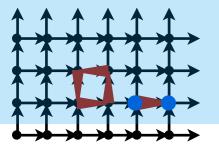

Shortcomings of the SM

- No dark matter or dark energy
- Predicts insufficient baryogenesis

NASA

- Why 3 generations? Why the observed pattern of quark & lepton masses and weak couplings?
- Weak scale relative to Planck scale
- ...

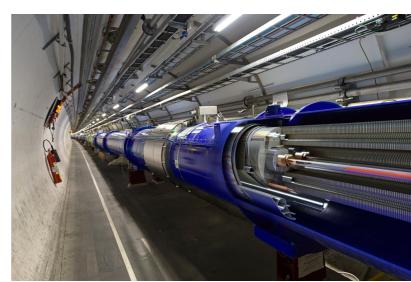

Searching for new physics

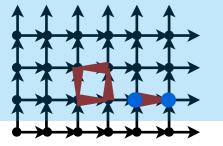

At the highest energies—LHC

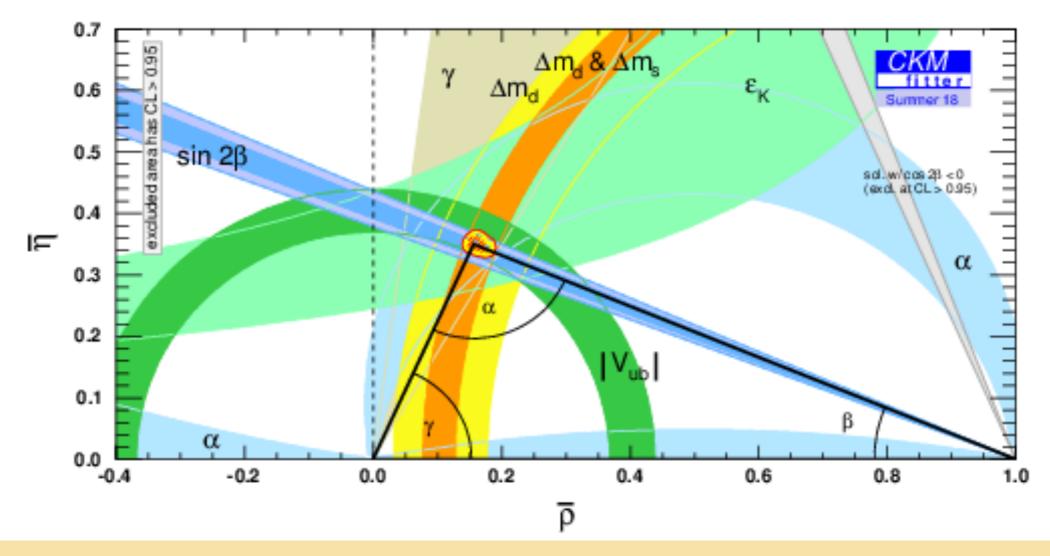

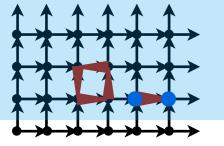

coffeeshopphysics.com

Searching for new physics

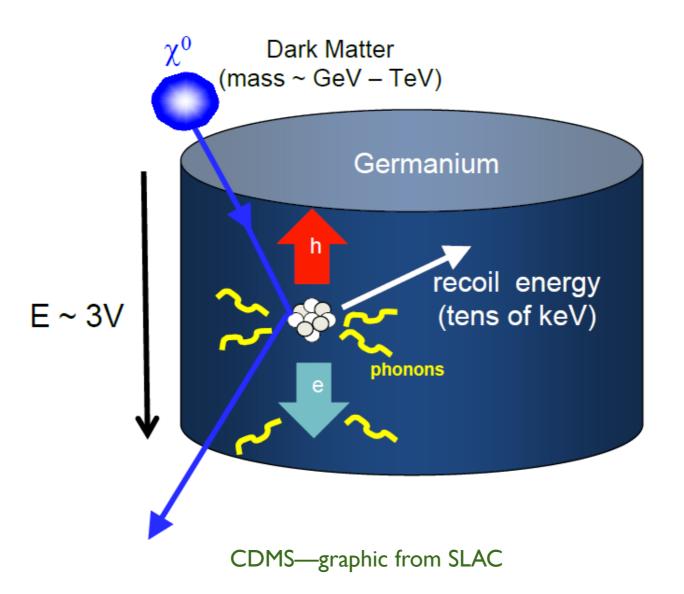

- In rare decays or precision measurements
 - Do all CP-violating processes in K and B decays agree with the SM?
 - Do precision measurements such as g_{μ} -2 agree with SM predictions?

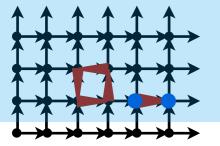

Searching for new physics

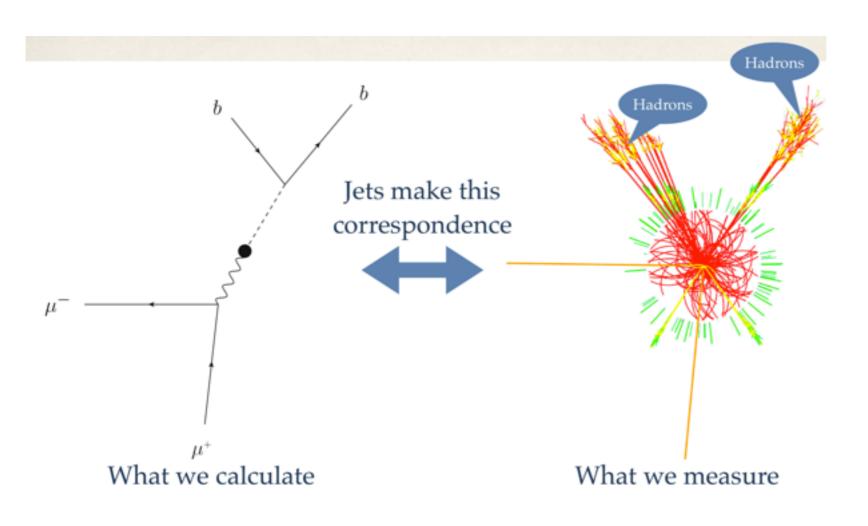

Dark matter searches

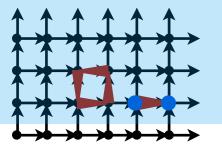

QCD as a background

Quarks become jets at the LHC

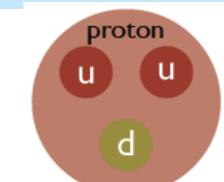

Disentangling requires perturbative QCD and modeling of non-perturbative confinement physics

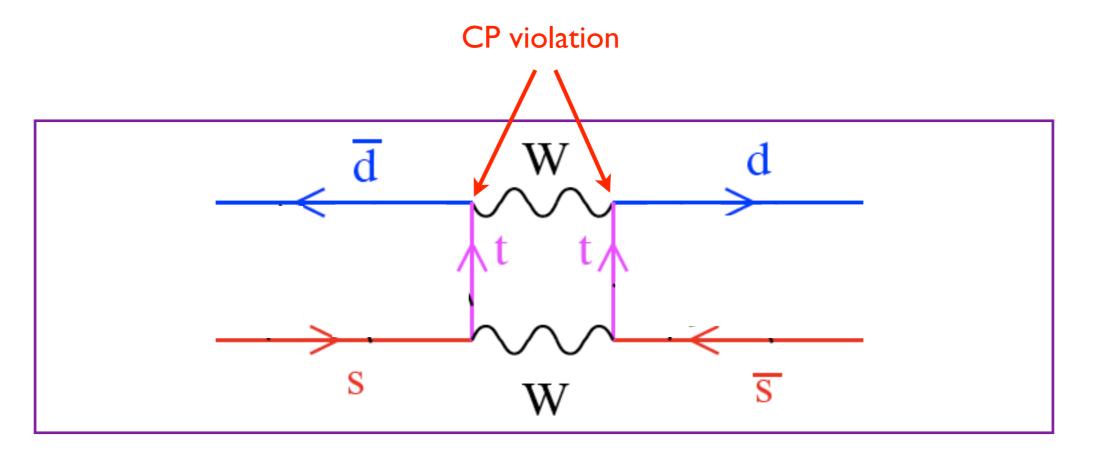

quantum diaries.org

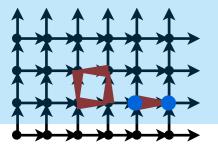

QCD as a background

- "Brown muck" distorts hadronic decays
- E.g. CP-violation in kaon-antikaon mixing

Quark level process that might hope to calculate in perturbation theory is really a hadronic process that involves non-perturbative QCD

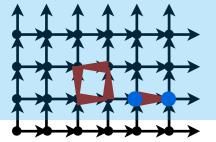

QCD as a background

- "Brown muck" distorts hadronic decays
- proton u u
- Distortions can be huge, e.g. $\Delta I = \frac{1}{2}$ rule

$$\frac{\Gamma(K_S^0 \to \pi\pi)}{\Gamma(K^+ \to \pi\pi)} \approx 330$$

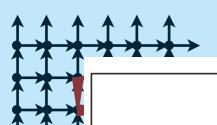

Same underlying quark weak decay: $s \longrightarrow \bar{u}ud$

 Must be able to calculate these "distortions" to interpret many rare decay experiments

Outline

- Standard model & searching for physics beyond

- Future outlook

What is QCD?

$$\mathcal{L}_{QCD} = \bar{q}_{a,i} \left[(i\gamma^{\mu}\partial_{\mu} - m_i) \, \delta_{ab}\delta_{ij} \right] q_{b,j} - g \, G^{a}_{\mu} \, \bar{q}_{i,b} \gamma^{\mu} T^{a}_{bc} \, q_{i,c} - \frac{1}{4} G^{a}_{\mu\nu} G^{\mu\nu}_{a}$$

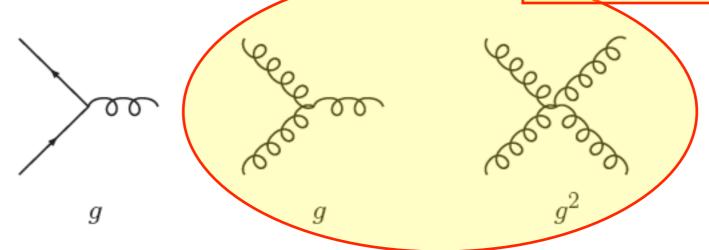

$$G^a_{\mu\nu} = \partial_\mu G^a_\nu - \partial_\nu G^a_\mu - g \ f^{abc} G^b_\mu G^c_\nu$$

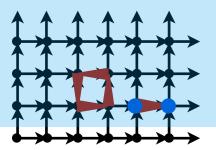

$$q_{a,i} = quark, 3 colors "a" and 6 flavors "i"$$

$$G_{\mu}^{a}=$$
 gluon, 8 colors "a"

g = QCD coupling

These make QCD challenging!

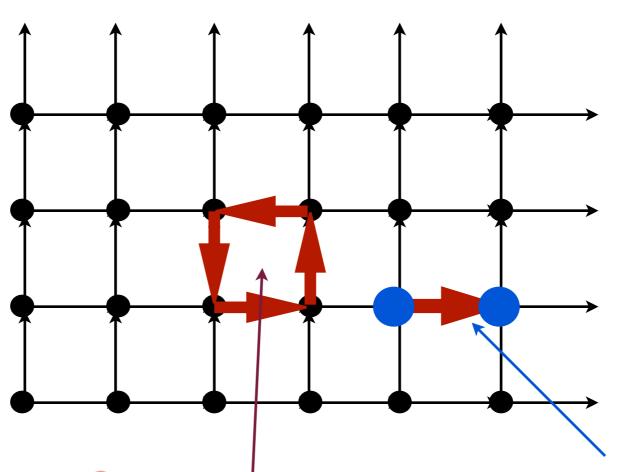

Lattice QCD

Ken Wilson, 1974

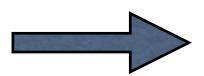

Space 3-dim

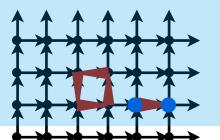

Euclidean time

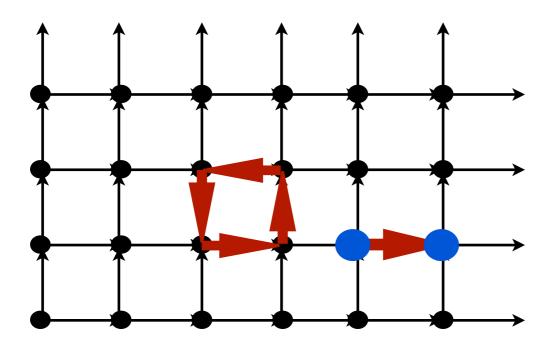

$$S_E^{
m latt} = -\sum_{\square} rac{6}{g^2} \operatorname{Re} \, \operatorname{tr}_N(U_{\square,\mu\nu}) - \sum_{q} \overline{q} (D_{\mu}^{
m lat} \gamma_{\mu} + a m_q) q$$

Wilson gauge action Lattice fermion action

Lattice QCD

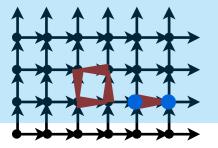

Use Feynman path integral definition of QM

$$Z_E = \int \prod dU d\overline{q} \, dq \, e^{-S_E^{
m lat}}$$

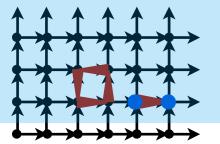

- Non-perturbative regularization of QFT
- Provides rigorous definition of QCD
 - Take $a \rightarrow 0$ by sending $g(a) \rightarrow 0$
- Amenable to numerical simulation using Monte Carlo methods

Simulating fermions is hard

$$\begin{split} Z_{\rm QCD} &= \int \prod dU d\bar{q} \, dq \, e^{-S_E^{\rm lat}} \\ &= \int dU e^{-S_{\rm glue}^{\rm lat}} \prod_q \det \left(D_\mu^{\rm lat} \gamma_\mu + m\right) \\ &= \int_{\rm gluon} q \quad \text{fermion loops} \end{split}$$

- Fermion determinant leads to non-local effective gauge action
- Orders of magnitude more difficult to simulate than the "pure gluon" theory

Timeline

Cray I, IMFlop/s

- 1974, invention of lattice QCD (K.Wilson)
- 1980, simulations of pure gluon theory demonstrate confinement (M. Creutz)

CPU speedup, theoretical & algorithmic advances have allowed lattice QCD to become a precision tool

2000's: fully unquenched era (light quark loops)

Cray 2, IGFlop/s

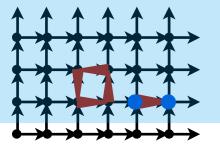

TFlop/s

Blue gene P, I PFlop/s

- 2009-10: simulations with physical up, down and strange quark make gene Q,
- Present: inclusion of electromagnetism; studies of light nuclei; .

10 PFlop/s

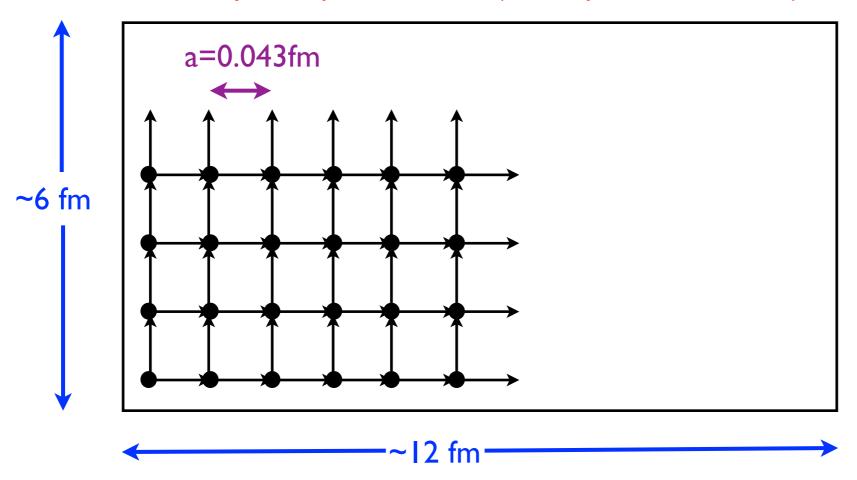

Summit (IBM-Nvidia), 100 PFlop/s

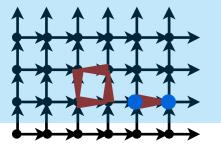

State of the art

44x 44x 44x288 lattice [MILC collaboration]

Highly Improved Staggered (HISQ) fermions Physical quark masses (in isospin limit: m_u=m_d)

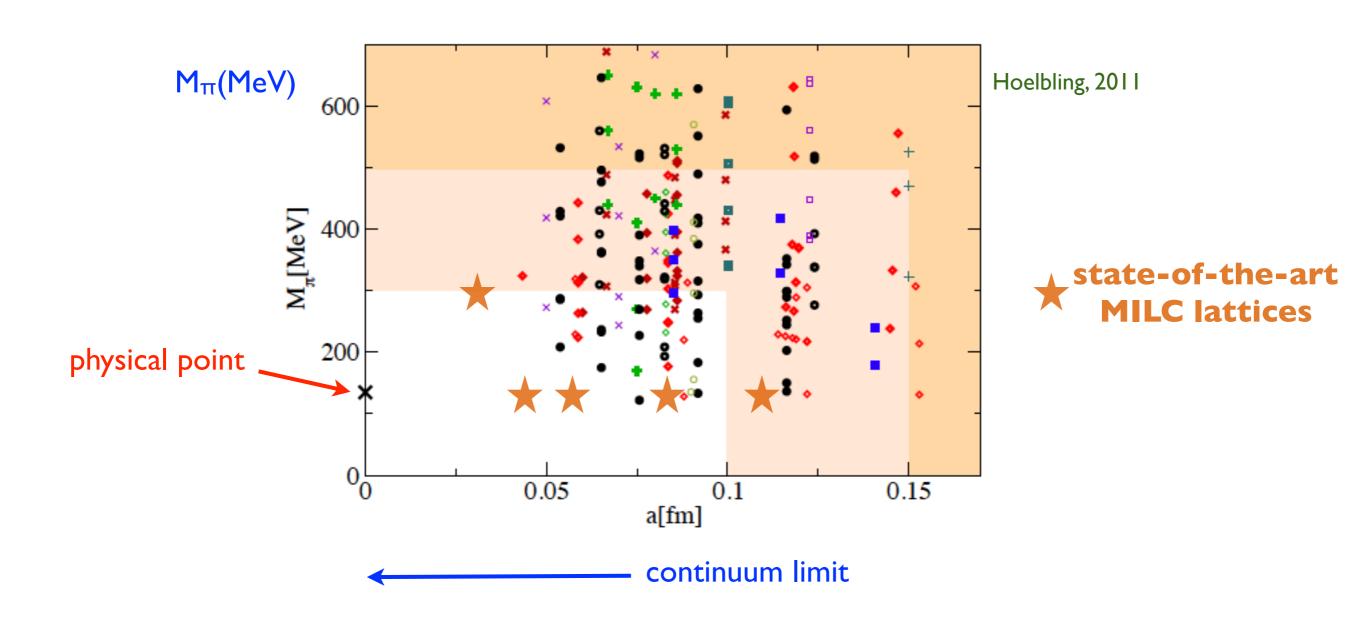

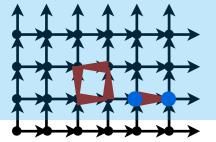

Need to invert matrices of size $\sim (3\times10^9) \times (3\times10^9)$

State of the art

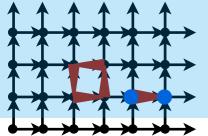

Extrapolating to the physical point

- Extending the LQCD frontier
- Future outlook

CKM matrix & CP violation

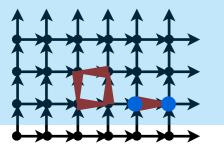

of the SM

CKM matrix & CP violation

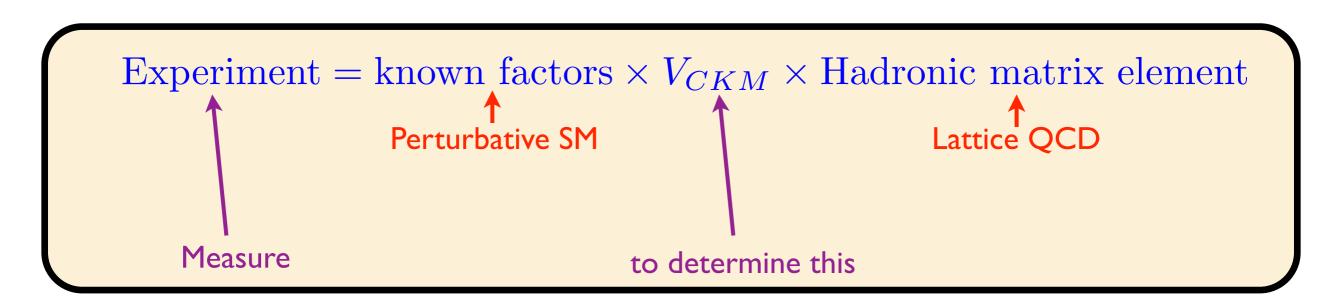

$$V_{CKM} = \begin{pmatrix} V_{ud} \ V_{us} \ V_{ub} \\ V_{cd} \ V_{cs} \ V_{cb} \\ V_{td} \ V_{ts} \ V_{tb} \end{pmatrix} \approx \begin{pmatrix} 1 - \frac{1}{2}\lambda^2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \frac{1}{2}\lambda^2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$
Unitary matrix
$$CP \text{ violation!}$$

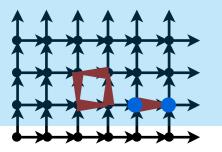

- Each element can be measured in several ways
- Consistency of SM requires all measurements to agree, and that V_{CKM} be unitary
- CP violating parameter η must explain observed
 CP violation in Kaon and B meson systems
- New physics would shows up as inconsistencies

Need for non-perturbative QCD

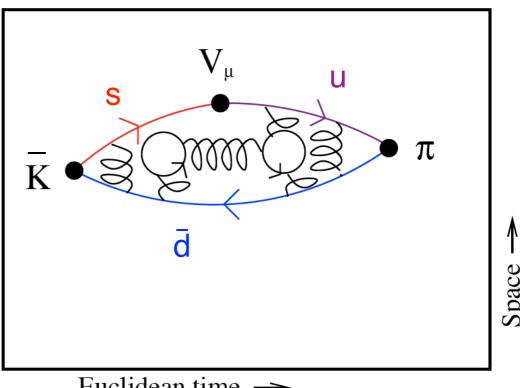

$$egin{pmatrix} \mathbf{V_{ud}} & \mathbf{V_{us}} & \mathbf{V_{ub}} \\ \pi
ightarrow \ell \nu & K
ightarrow \ell \nu & B
ightarrow \pi \ell \nu \\ K
ightarrow \pi \ell \nu & K
ightarrow \pi \ell \nu \\ K
ightarrow \pi \ell \nu & V_{cb} & V_{cb} \\ D
ightarrow \ell \nu & D_s
ightarrow \ell \nu & B
ightarrow D \ell \nu \\ D
ightarrow \pi \ell \nu & D
ightarrow K \ell \nu & B
ightarrow D^* \ell \nu \\ V_{td} & V_{ts} & V_{tb} \\ B_d
ightarrow \overline{B}_d & B_s
ightarrow \overline{B}_s \\ K_0
ightarrow \overline{K}_0 & K_0
ightarrow \overline{K}_0 \\ \end{array}$$

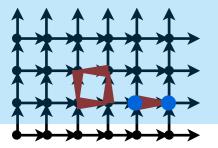

Example: $K \rightarrow \pi$ form factor

- Experimental measurement: $\overline{K}^0 \longrightarrow \pi^+ e^- \overline{\nu}$
- Underlying process: $s \longrightarrow ue^{-}\overline{\nu}$
- V_{us} CKM element:
- Required matrix element: $\langle \pi(p_2)|V_{\mu}|K(p_1)\rangle \sim f_+(0)$
- Lattice QCD calculation:

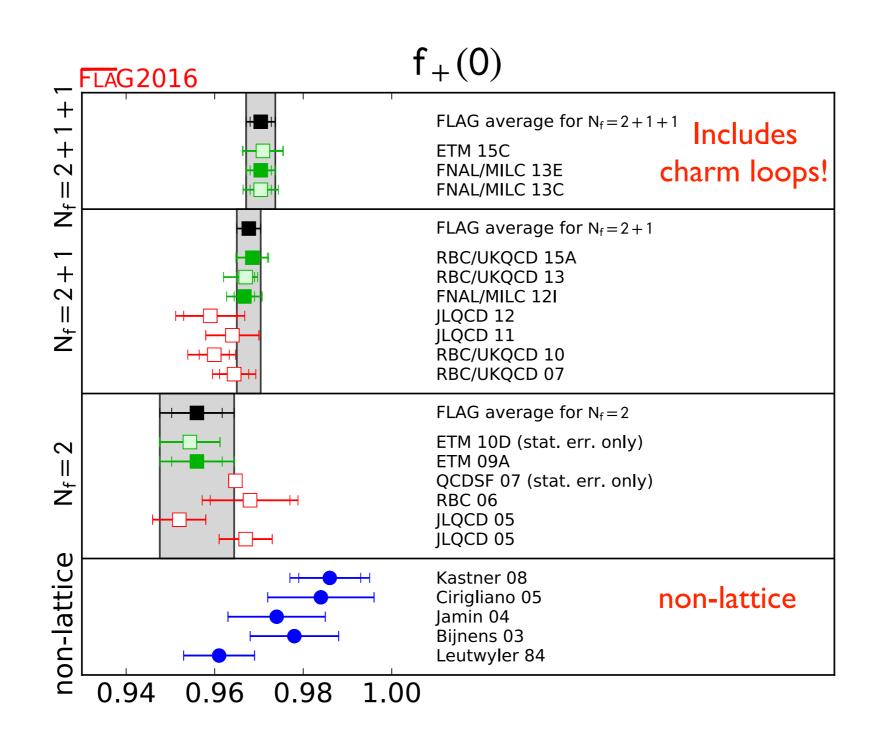

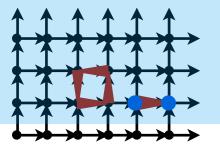

Euclidean time ->

Results for $K \rightarrow \pi$ form factor

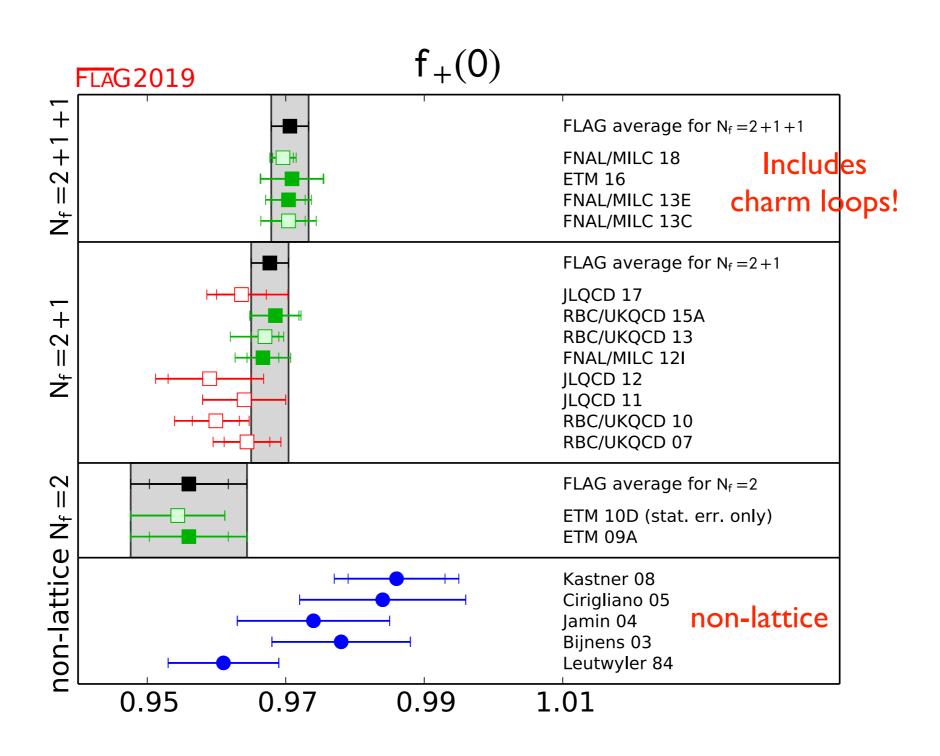

$$f_{+}(0) = 0.9704(33) [N_f=2+1+1]$$

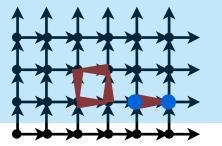

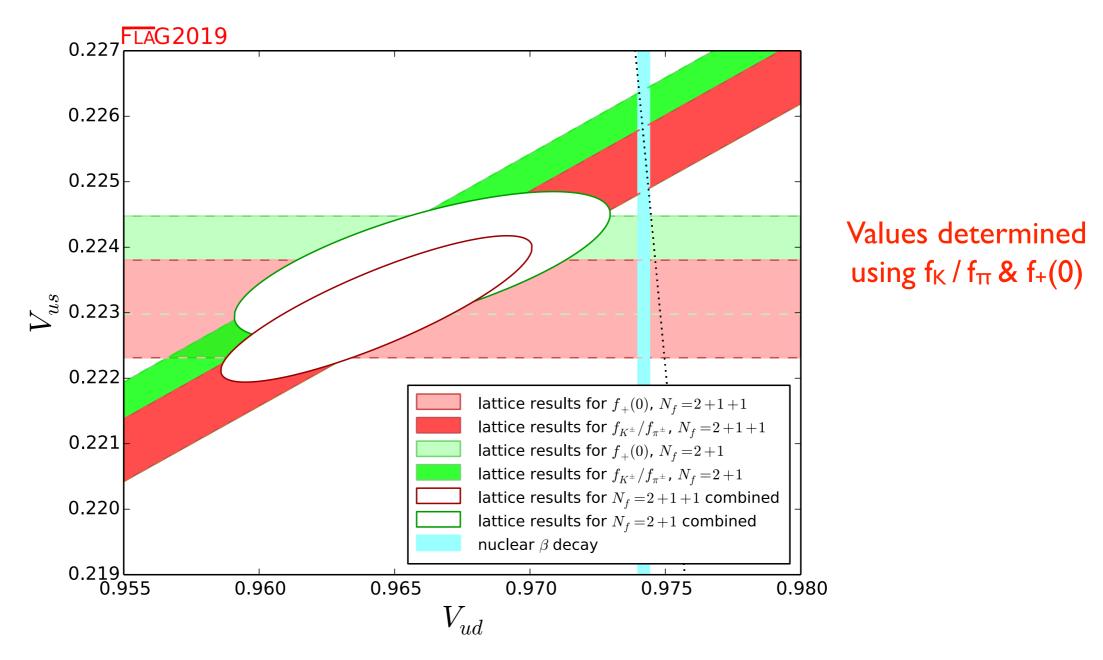

Results for $K \rightarrow \pi$ form factor

$$f_{+}(0) = 0.9706(27) [N_f=2+1+1]$$

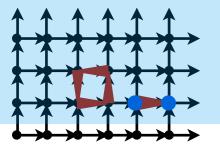

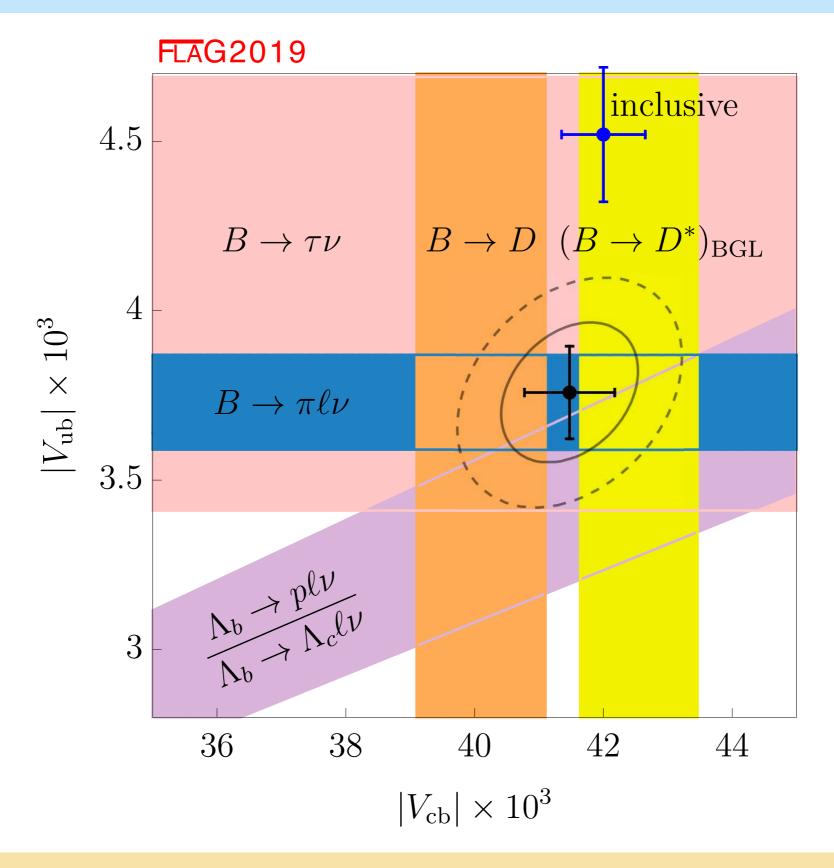

Results for Vud & Vus

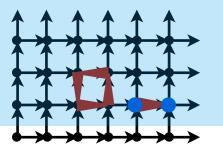

Consistent with unitarity: $|V_{ud}|^2 + |V_{us}|^2 + |V_{ub}|^2 = 0.9797(74)$

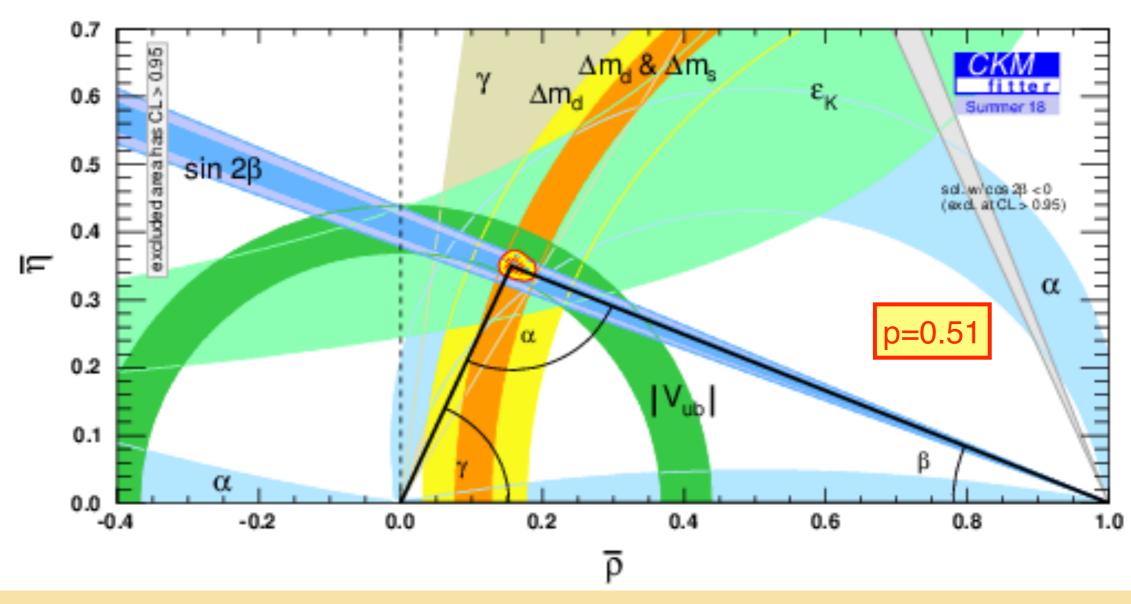

Some tensions

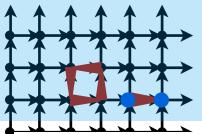

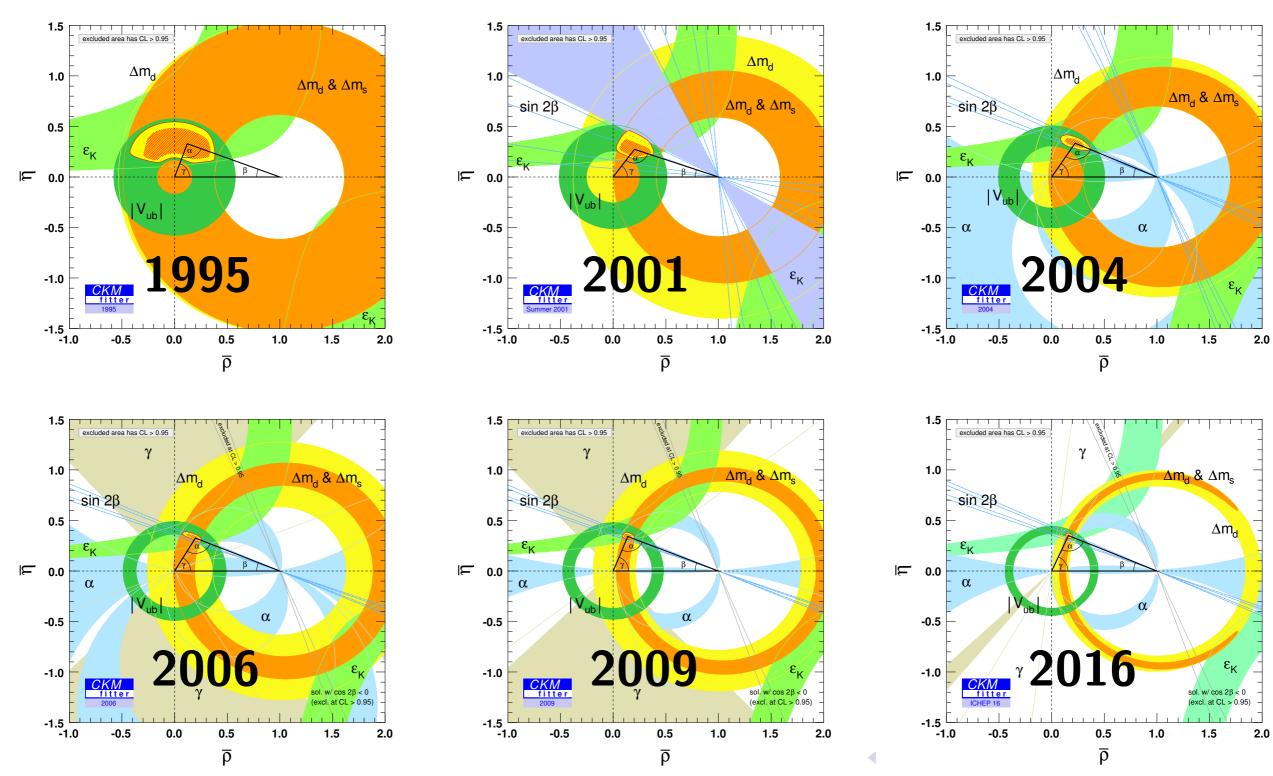

...but overall consistency

$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \approx \begin{pmatrix} 1 - \frac{1}{2}\lambda^2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \frac{1}{2}\lambda^2 & A\lambda^2 \\ A\lambda^3(1 - \rho)(i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

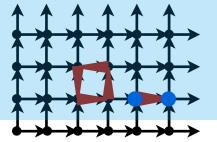

History of steady progress

"Gold plated"

- Processes involving single hadrons are (by now) straightforward to calculate using LQCD
 - Hadron masses, decay constants, form factors, quark masses, α_s , K, D & B mixing matrix elements
 - E.g. $B_K = 0.76 \pm 0.01$ [FLAG16]

Beyond "gold plated"

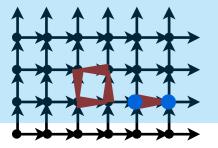

- Processes involving two hadrons are now beginning to be accessible
 - E.g. K→ππ decays
 - Does the SM reproduce the $\Delta I = I/2$ rule?

$$\frac{\Gamma(K_S^0 \to \pi\pi)}{\Gamma(K^+ \to \pi\pi)} \approx 330$$

• Does the SM reproduce direct CP-violation in $K \rightarrow \pi \pi$?

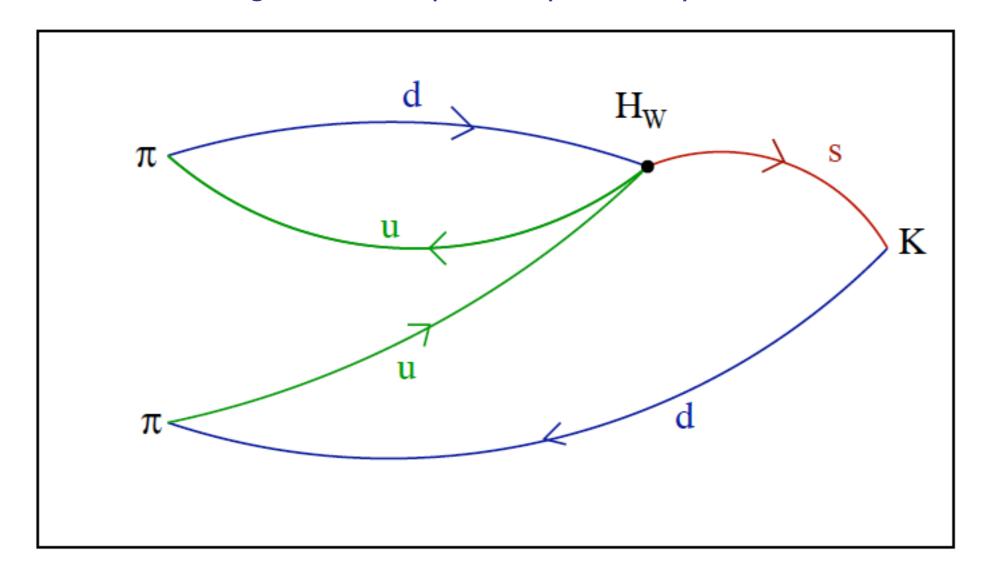

$$\frac{\Gamma(K_L \to \pi^0 \pi^0)}{\Gamma(K_S \to \pi^0 \pi^0)} \frac{\Gamma(K_S \to \pi^+ \pi^-)}{\Gamma(K_L \to \pi^+ \pi^-)} \approx 1 - 6 \text{Re}(\epsilon'/\epsilon)$$

$$\varepsilon'/\varepsilon = 1.63(0.26) \ 10^{-3}$$

K→ππ amplitude

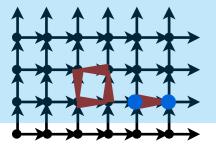

gluons & sea-quark loops now implicit

space

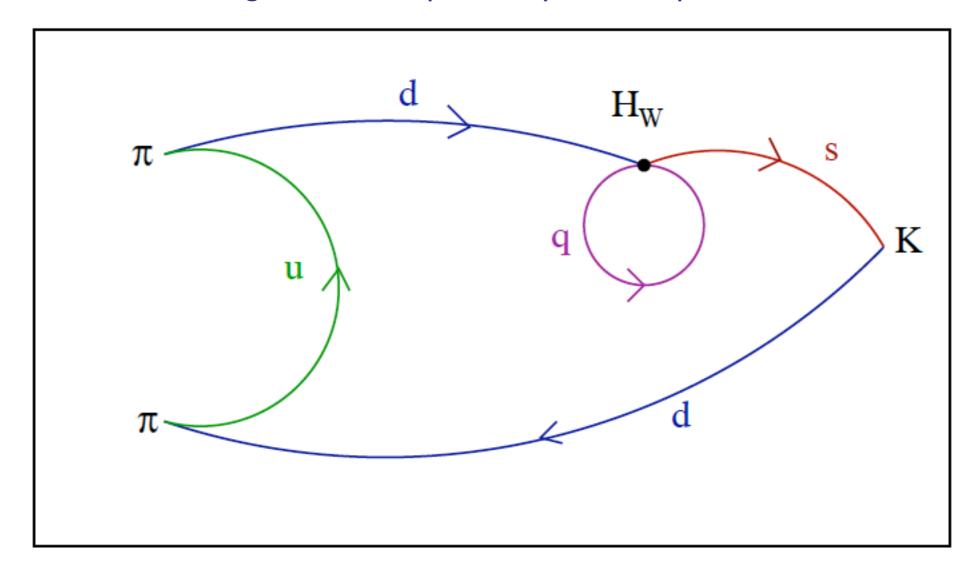

Euclidean time

Many Wick contractions—some with poor signal/noise

Euclidean time

Many Wick contractions—some with poor signal/noise

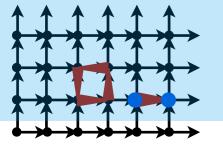

K→ππ amplitude

gluons & sea-quark loops now implicit

Euclidean time

Many Wick contractions—some with poor signal/noise

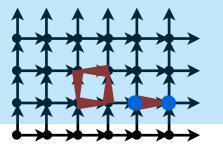

Calculational challenges

- Quark-disconnected Wick contractions
 - Solved using new noise-reduction methods
- Breaking of chiral symmetry by lattice action
 - Solved using Domain-wall fermions
- Connecting finite-volume matrix element to measured infinite-volume one

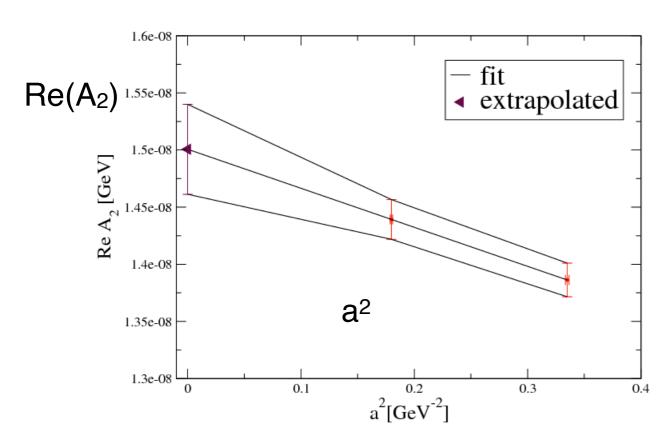

$$_L\langle\pi\pi|\mathcal{H}_W|K\rangle_L$$
 \longrightarrow $\langle\pi\pi|\mathcal{H}_W|K\rangle$

Solved by large box (~6 fm) & using QFT to relate finite & infinite volume two-pion states [Lüscher, ...]

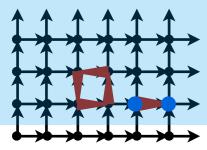

Pioneering K→ππ results

 Amplitude for K⁺→ππ (isospin 2 final state) at physical quark masses in fully controlled calculation

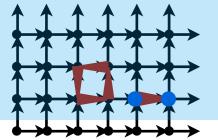

[RBC/UKQCD 1502.00263]

- Result: $Re(A_2) = 1.50 (15) GeV$
- Consistent with experiment!
 Re(A₂)=1.479(3) 10-8 GeV (K+ decays)

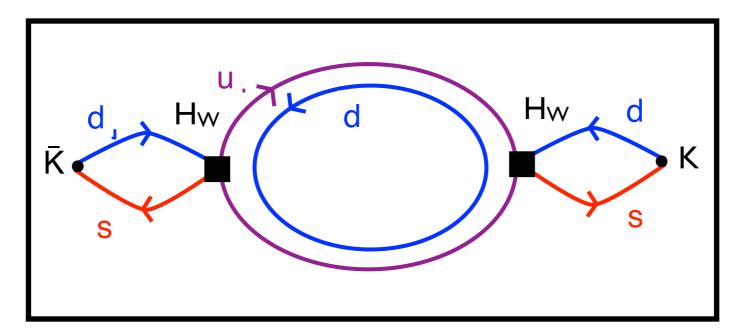

Pioneering K→ππ results

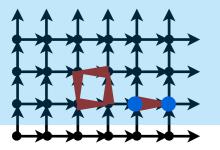

- Amplitude for isospin 0 ππ final state <u>at physical point</u> (but so far with only a single lattice spacing a≈0.15fm)
 [RBC/UKQCD 1505.07863]
 - Result (without all errors controlled): $Re(A_0) = 4.7(1.6) \ 10^{-7} \ GeV$
 - Consistent with experiment: $Re(A_2)=3.3(2)\ 10^{-7}\ GeV$
 - Reproduces the $\Delta I = \frac{1}{2}$ rule from first principles!
- Fully controlled results in next few years

Future K→ππ results

- CP violation in $K \rightarrow \pi \pi$
 - First result obtained: $\epsilon'/\epsilon = 0.1(7) \cdot 10^{-3}$ [RBC/UKQCD 1505.07863]
 - Will know in a few years if SM explains $\epsilon'/\epsilon = 1.63(26) \ 10^{-3}$
- Calculation of K_L — K_S mass difference ΔM_K
 - Method developed and tested: fully controlled result in 3-5 years?

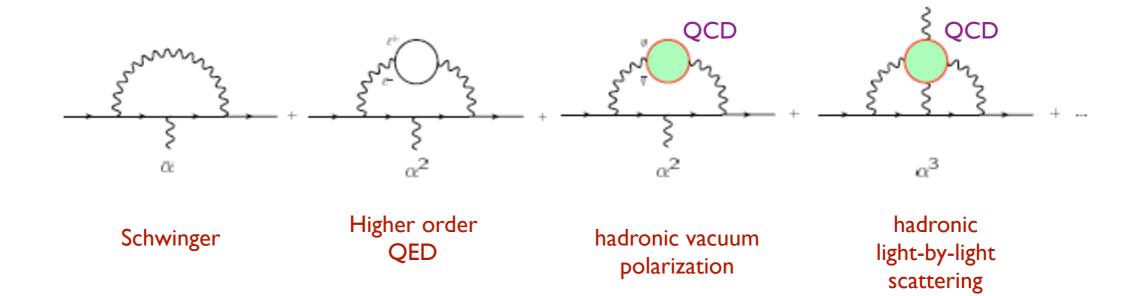

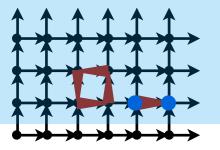

Muon 9-2

Magnetic moment of muon is proportional to its spin

$$\vec{\mu} = g\left(\frac{e}{2m}\right)\vec{S}$$
 $g = 2 + \frac{a_{\mu}}{2}$ $a_{\mu} = \frac{\alpha_{EM}}{2\pi} + \dots$

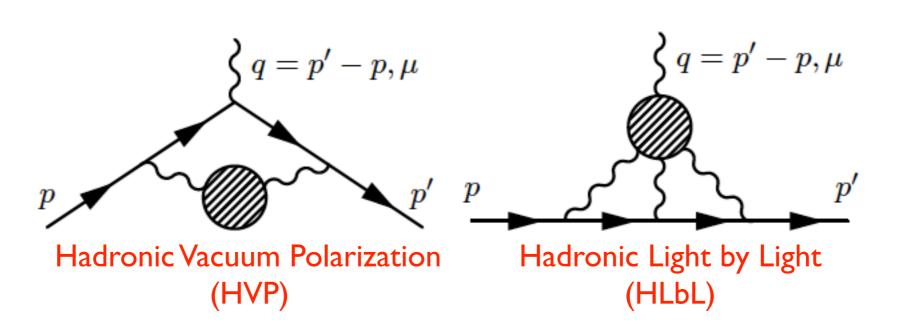

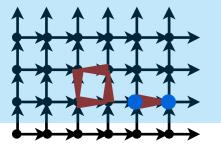

Dominant theory error is from QCD!

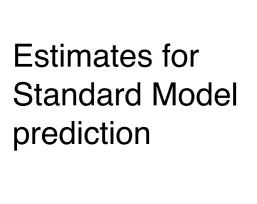

Muon 9-2

Muon 9-2

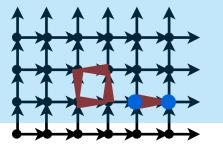

In tension with present experiment

New experiment can discover new physics!

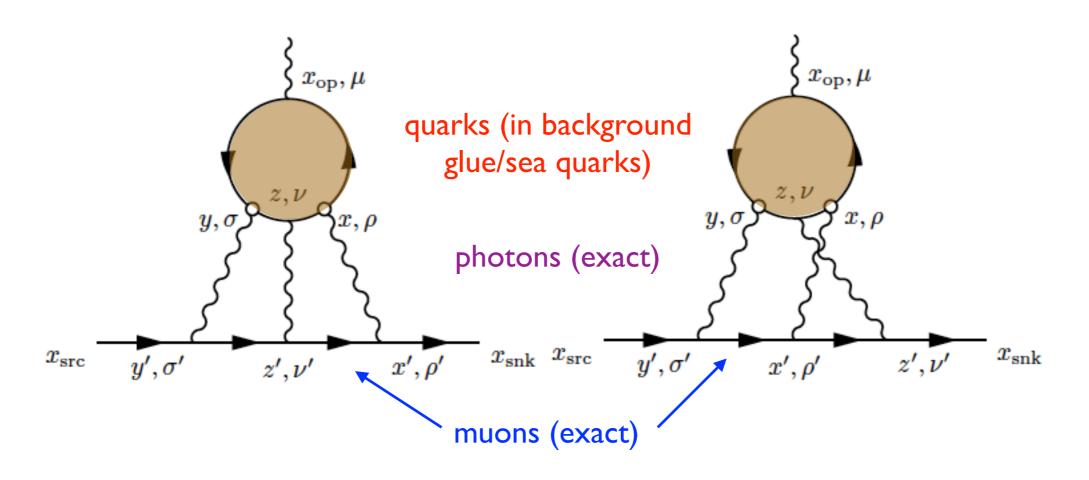

But to do so requires precise LQCD results

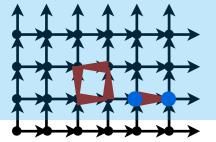

Hadronic light-by-light from LQCD

• Lattice result from direct calculation at physical masses in few yrs [RBC Collab., Blum et al. and other groups]

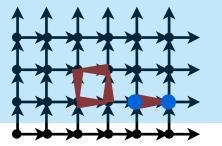

Methods now have 20% statistical errors; systematics under study

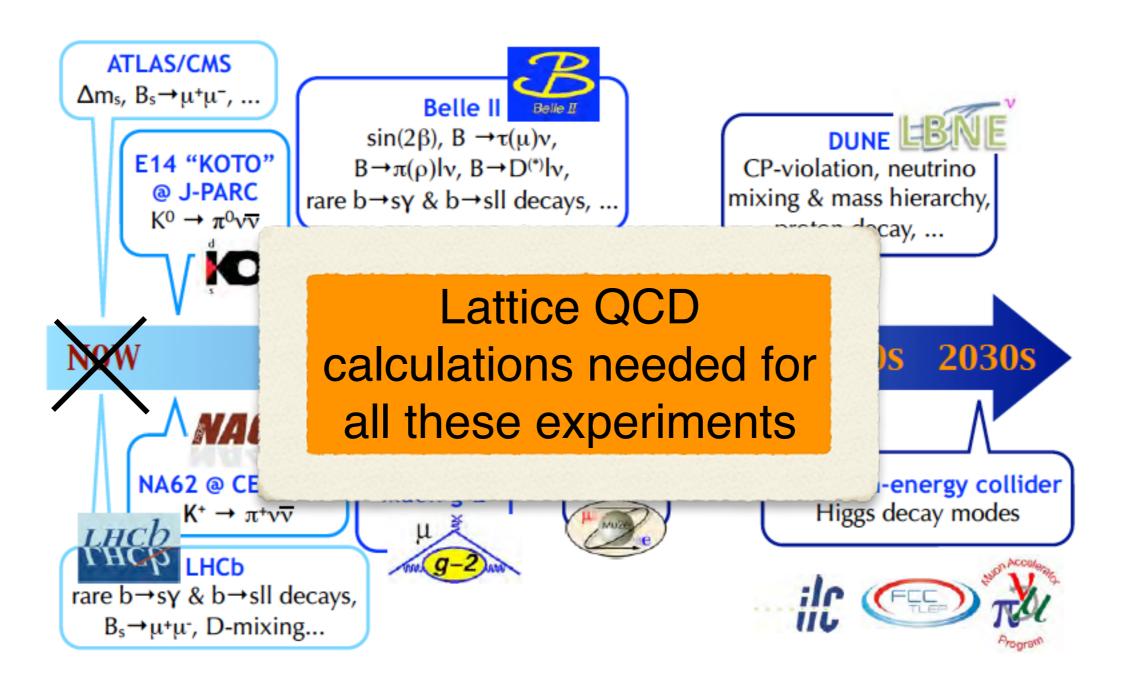

Outline

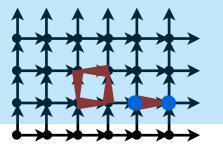

- Standard model & searching for physics beyond
- QCD & Lattice QCD
- High precision lattice QCD
- Constraining the Standard Model with LQCD
- Extending the LQCD frontier
- Future outlook

Experimental frontier

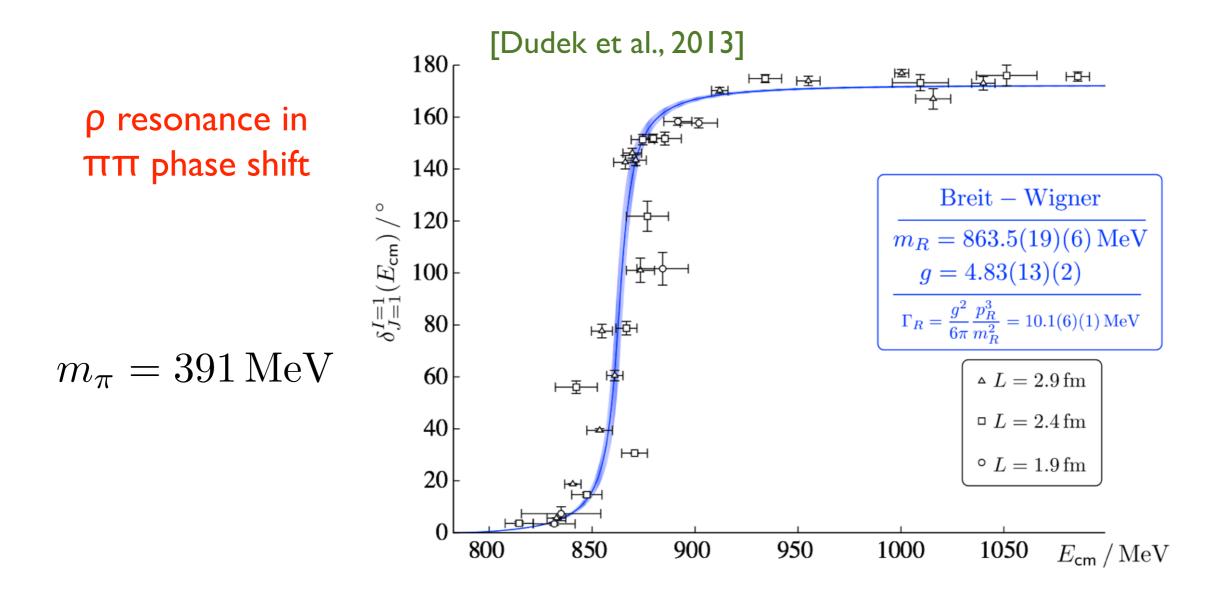

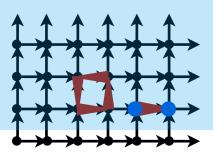

Ruth Van de Water

Coming in the near future

- 3 or more particles, e.g. $K \rightarrow \pi \pi \pi$
- Resonance properties from Lattice QCD

Open problems

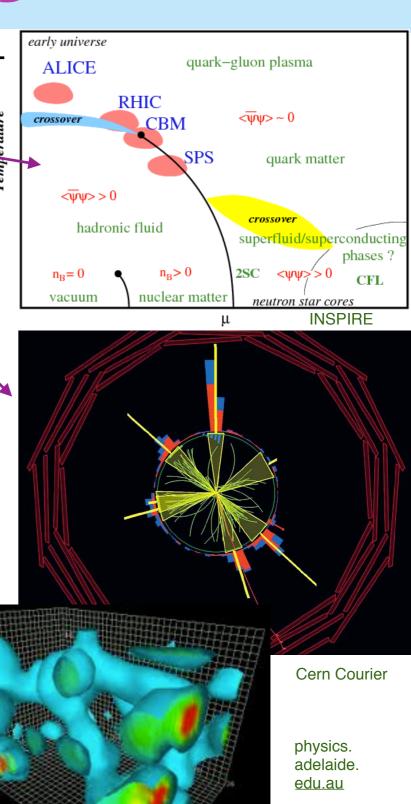

Non-zero density (e.g. center of neutron stars)

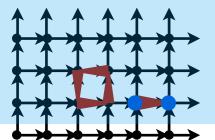

Real-time processes (e.g hadronization of jets)

• Decays with many open channels, e.g. $B \rightarrow \pi \pi$

Qualitative understanding of confinement/vacuum

Lattice formulation of chiral gauge theories
