The Gauss-Lucas theorem (1830s). The roots of p'_n are contained in the convex hull of the roots of p_n .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

The Gauss-Lucas theorem (1830s). The roots of p'_n are contained in the convex hull of the roots of p_n .

Proof. The 'electrostatic interpretation':

$$\frac{p_n'(z)}{p_n(z)} = \sum_{k=1}^n \frac{1}{z-z_k}.$$

The Gauss-Lucas theorem (1830s). The roots of p'_n are contained in the convex hull of the roots of p_n .

Proof. The 'electrostatic interpretation':

$$\frac{p_n'(z)}{p_n(z)} = \sum_{k=1}^n \frac{1}{z-z_k}.$$

If you are outside the convex hull, the charges 'push you away'.

$$\frac{p'_n(z)}{p_n(z)} = \sum_{k=1}^n \frac{1}{z - z_k}.$$

▲□▶▲□▶▲≣▶▲≣▶ ≣ のへで

$$\frac{p'_n(z)}{p_n(z)} = \sum_{k=1}^n \frac{1}{z - z_k}.$$

◆□▶ ◆□▶ ◆目▶ ◆目▶ ◆□▶

$$p_n(x) = \prod_{k=1}^n (x - x_k).$$

$$p_n(x) = \prod_{k=1}^n (x - x_k).$$

Between any two roots there is a maximum or a minimum, thus a root of p'_n .

$$p_n(x) = \prod_{k=1}^n (x - x_k).$$

Between any two roots there is a maximum or a minimum, thus a root of p'_n . Moreover, there are n-1 intervals between the n roots, so each interval has exactly one root. Thus the roots of p_n and the roots of p'_n INTERLACE.

$$p_n(x) = \prod_{k=1}^n (x - x_k).$$

Between any two roots there is a maximum or a minimum, thus a root of p'_n . Moreover, there are n-1 intervals between the n roots, so each interval has exactly one root. Thus the roots of p_n and the roots of p'_n INTERLACE.

Suppose now the roots are distributed according to some 'nice' measure μ and $n \to \infty$.

Main Question

What about the roots of

$$p_n^{(t \cdot n)}$$
 where $0 < t < 1$?

Let us denote the answer by u(t, x).

1.
$$\int_{\mathbb{R}} u(t, x) dx = 1 - t$$
.
2. $\int_{\mathbb{R}} u(t, x) x dx = (1 - t) \int_{\mathbb{R}} u(0, x) x dx$
3. $\int_{\mathbb{R}} \int_{\mathbb{R}} u(t, x) (x - y)^2 u(t, y) dx dy = (1 - t)^3 \int_{\mathbb{R}} \int_{\mathbb{R}} u(0, x) (x - y)^2 u(0, y) dx dy$

This means: the distribution shrinks linearly in mass, its mean is preserved and the mass is distributed over area $\sim \sqrt{1-t}$.

If there exists a nice and continuous evolution, then it is described by

$$\frac{\partial u}{\partial t} + \frac{1}{\pi} \frac{\partial}{\partial x} \arctan\left(\frac{Hu}{u}\right) = 0 \quad \text{on supp}(u)$$

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

So the relevant question is: are there nice special solutions that we can construct? For this we need polynomials p_n whose roots have a nice distribution and whose derivatives $p_n^{(k)}$ also have a nice distribution?

- 1. Hermite polynomials
- 2. (associated) Laguerre polynomials

Hermite polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy a nice recurrence relation

$$\frac{d^m}{dx^m}H_n(x)=\frac{2^nn!}{(n-m)!}H_{n-m}(x).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Hermite polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy a nice recurrence relation

$$\frac{d^m}{dx^m}H_n(x)=\frac{2^nn!}{(n-m)!}H_{n-m}(x).$$

Moreover, the roots of H_n converge, in a suitable sense, to

$$\mu = \frac{1}{\pi} \sqrt{2n - x^2} dx.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Hermite polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy a nice recurrence relation

$$\frac{d^m}{dx^m}H_n(x)=\frac{2^nn!}{(n-m)!}H_{n-m}(x).$$

Moreover, the roots of H_n converge, in a suitable sense, to

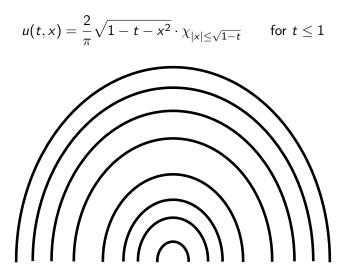

$$\mu = \frac{1}{\pi}\sqrt{2n - x^2}dx.$$

This suggests that

$$u(t,x) = \frac{2}{\pi} \sqrt{1 - t - x^2} \cdot \chi_{|x| \le \sqrt{1 - t}}$$
 for $t \le 1$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

should be a solution of the PDE (and it is).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─のへで

(Associated) Laguerre polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy the recurrence relation

$$\frac{d^k}{dx^k} L_n^{(\alpha)}(x) = (-1)^k L_{n-k}^{(\alpha+k)}(x).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

(Associated) Laguerre polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy the recurrence relation

$$\frac{d^{k}}{dx^{k}}L_{n}^{(\alpha)}(x) = (-1)^{k}L_{n-k}^{(\alpha+k)}(x).$$

The roots converge in distribution to the Marchenko-Pastur distribution

$$v(c,x) = \frac{\sqrt{(x_+ - x)(x - x_-)}}{2\pi x} \chi_{(x_-, x_+)} dx$$

where

$$x_{\pm} = (\sqrt{c+1} \pm 1)^2.$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

(Associated) Laguerre polynomials $H_n : \mathbb{R} \to \mathbb{R}$ satisfy the recurrence relation

It thus remains to understand the behavior of the local term.

The local term is

$$\sum_{|x_k-x| \text{ small}} \frac{1}{x-x_k}.$$

The local term is

$$\sum_{|x_k-x| \text{ small}} \frac{1}{x-x_k}.$$

Crystallization means that the roots form, locally, an arithmetic progressions

The local term is

$$\sum_{|x_k-x| \text{ small}} \frac{1}{x-x_k}.$$

Crystallization means that the roots form, locally, an arithmetic progressions and thus

$$\sum_{|x_k-x| ext{ small }} rac{1}{x-x_k} \sim \sum_{\ell \in \mathbb{Z}} rac{1}{x-\left(x_k+rac{\ell}{u(t,x)n}
ight)}.$$

The local term is

$$\sum_{|x_k-x| ext{ small }} rac{1}{x-x_k}.$$

Crystallization means that the roots form, locally, an arithmetic progressions and thus

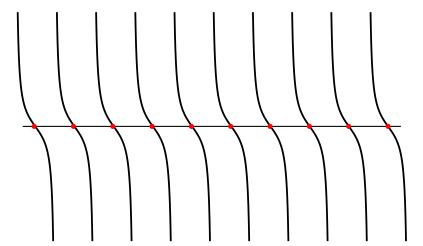

$$\sum_{|x_k-x| \text{ small}} rac{1}{x-x_k} \sim \sum_{\ell \in \mathbb{Z}} rac{1}{x-\left(x_k+rac{\ell}{u(t,x)n}
ight)}.$$

We are in luck: this sum has a closed-form expression due to Euler

$$\pi \cot \pi x = \frac{1}{x} + \sum_{n=1}^{\infty} \left(\frac{1}{x+n} + \frac{1}{x-n} \right) \quad \text{for } x \in \mathbb{R} \setminus \mathbb{Z}.$$

The Local Field

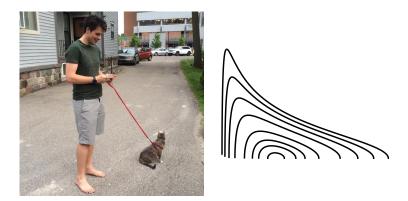

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

The Local Field

We can then predict the behavior of the roots of the derivative: they are in places where the local (near) field and the global (far) field cancel out. This leads to the desired equation.

where $\gamma_n \sim \mathcal{N}(0,1)$ and He_ℓ is the $\ell-$ th Hermite polynomial. **Remarks.**

The roots of the Hermite polynomial have a semicircle density.
 If x₁, x₂,..., x_n ~ X, then

$$\frac{x_1+\cdots+x_n}{\sqrt{n}}\sim \mathcal{N}(0,1)$$

and the mean of the roots is preserved under differentiation (that's why there is a random shift).

A Formal Computation (now Theorem of Kabluchko-Hoskins) Under some reasonable assumptions

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

This has a large number of implications.

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

This has a large number of implications.

. . .

Fractional Free Convolution preserves free cumulants

$$\kappa_1(\mu) = \int_{\mathbb{R}} x d\mu$$

 $\kappa_2(\mu) = \int_{\mathbb{R}} x^2 d\mu - \left(\int_{\mathbb{R}} x d\mu\right)^2$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

This has a large number of implications.

. . .

Fractional Free Convolution preserves free cumulants

$$\kappa_{1}(\mu) = \int_{\mathbb{R}} x d\mu$$

$$\kappa_{2}(\mu) = \int_{\mathbb{R}} x^{2} d\mu - \left(\int_{\mathbb{R}} x d\mu\right)^{2}$$

since

$$\kappa_n(\mu^{\boxplus k}) = k \cdot \kappa_n(\mu).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

This has a large number of implications.

Fractional Free Convolution preserves free cumulants

$$\begin{split} \kappa_1(\mu) &= \int_{\mathbb{R}} x d\mu \\ \kappa_2(\mu) &= \int_{\mathbb{R}} x^2 d\mu - \left(\int_{\mathbb{R}} x d\mu \right)^2 \end{split}$$

since

$$\kappa_n(\mu^{\boxplus k}) = k \cdot \kappa_n(\mu).$$

Infinitely many conserved quantities.

. . .

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

has a large number of implications.

$$\mu^{\boxplus k} = u\left(1 - \frac{1}{k}, \frac{x}{k}\right) dx.$$

DYNAMICS OF ZEROES UNDER REPEATED DIFFERENTIATION

JEREMY HOSKINS AND ZAKHAR KABLUCHKO

ABSTRACT. Consider a random polynomial P_n of degree n whose roots are independent random variables sampled according to some probability distribution μ_0 on the complex plane C. It is natural to conjecture that, for a fixed $t \in [0, 1)$ and as $n \to \infty$, the zeroes of the [tn]-th derivative of P_n are distributed according to some measure μ_t on C. Assuming either that μ_0 is concentrated on the real line or that it is rotationally invariant, Steinerberger [Proc. AMS, 2019] and O'Rourke and Steinerberger [arXiv:1910.12161] derived nonlocal transport equations for the density of roots. We introduce a different method to treat such problems. In the rotationally invariant case, we obtain a closed formula for $\mu(x, t)$ the asymptotic density of the gradie larget of the grade of the line larget of the state.

THE FLOW OF POLYNOMIAL ROOTS UNDER DIFFERENTIATION

ALEXANDER KISELEV AND CHANGHUI TAN

ABSTRACT. The question about the behavior of gaps between zeros of polynomials under differentiation is classical and goes back to Marcel Riesz. In this paper, we analyze a nonlocal nonlinear partial differential equation formally derived by Stefan Steinerberger [55] to model dynamics of roots of polynomials under differentiation. Interestingly, the same equation has also been recently obtained formally by Dimitri Shlyakhtenko and Terence Tao as the evolution equation for free fractional convolution of a measure [51] - an object in free probability that is also related to minor processes for random matrices. The partial differential equation bears striking resemblance to hydrodynamic models used to describe the collective behavior of agents (such as birds, fish or robots) in mathematical biology. We consider periodic setting and show global regularity and exponential in time convergence to uniform density for solutions corresponding to strictly positive smooth initial data. In the second part of the paper we connect

Sean O'Rourke and I tried to see whether the equation simplifies if we assume that the initial distribution is radial around the origin. If the density is $\psi(t, x)$, then

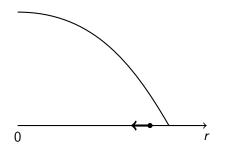

$$\frac{\partial \psi}{\partial t} = \frac{\partial}{\partial x} \left(\left(\frac{1}{x} \int_0^x \psi(s) ds \right)^{-1} \psi(x) \right).$$

$$\frac{\partial \psi}{\partial t} = \frac{\partial}{\partial x} \left(\left(\frac{1}{x} \int_0^x \psi(s) ds \right)^{-1} \psi(x) \right)$$

has a nice closed form solution

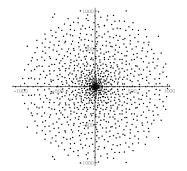

$$u(t,x)=\chi_{0\leq x\leq 1-t}.$$

$$\frac{\partial \psi}{\partial t} = \frac{\partial}{\partial x} \left(\left(\frac{1}{x} \int_0^x \psi(s) ds \right)^{-1} \psi(x) \right)$$

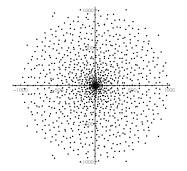

has a nice closed form solution

$$u(t,x) = \chi_{0 \le x \le 1-t}$$

This corresponds to Random Taylor Polynomials.

Random Taylor polynomials are defined by

$$p_n = \sum_{k=0}^n \gamma_k \frac{z^k}{k!},$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

where $\gamma_k \sim \mathcal{N}(0, 1)$.

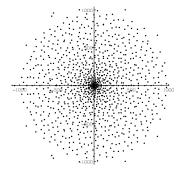

Random Taylor polynomials are defined by

$$p_n = \sum_{k=0}^n \gamma_k \frac{z^k}{k!},$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

where $\gamma_k \sim \mathcal{N}(0, 1)$. They are preserved under differentiation.

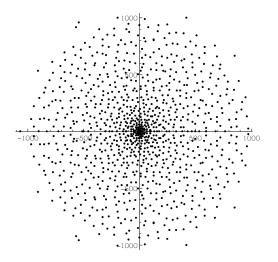

Random Taylor polynomials are defined by

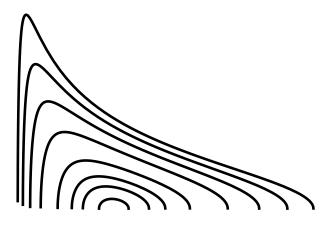

$$p_n = \sum_{k=0}^n \gamma_k \frac{z^k}{k!},$$

where $\gamma_k \sim \mathcal{N}(0, 1)$. They are preserved under differentiation. Theorem (Kabluchko & Zaporozhets)

$$\frac{1}{n}\sum_{k=1}^n \delta_{z_kn^{-1}} \to \frac{\chi_{|z|\leq 1}}{2\pi|z|} \qquad \text{as } n\to\infty.$$

Kabluchko & Hoskins give many more examples of solutions.

THANK YOU!
