## TCSS 422 – OFFICE HRS – WINTER 2026

- Office Hours plan for Winter:**
- Tuesday 2:30 - 3:30 pm Instructor Wes, Zoom**
- Tue/Thur 6:00 - 7:00 pm Instructor Wes, CP 229/Zoom**
- Tue 6:00 – 7:00 pm GTA Robert, Zoom/MDS 302**
- Wed 1:00 – 2:00 pm GTA Robert, Zoom/MDS 302**
- Instructor is available after class at 6pm in CP 229 each day**

## TCSS 422 - Online Daily Feedback Survey - 4/1

### Quiz Instructions

Question 1

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

1	2	3	4	5	6	7	8	9	10
mostly Review to me			equal		New and Review				mostly New to me

Question 2

Please rate the pace of today's class:

1	2	3	4	5	6	7	8	9	10
slow				just right					fast

January 22, 2026      TCSS422: Computer Operating Systems [Spring 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L5.6

6

## MATERIAL / PACE

- Please classify your perspective on material covered in today's class (32 of 46 respondents – 69.5%):
- **\*\*\*SURVEY ISSUE\*\*\*:** Canvas Survey Initially Unavailable, NOW POSTED AND AVAILABLE until Mon Jan 26
- 1-mostly review, 5-equal new/review, 10-mostly new
- **Average – 7.03 (↑ - previous 6.54)**
- Please rate the pace of today's class:
- 1-slow, 5-just right, 10-fast
- **Average – 5.08 (↑ - previous 4.73)**

LS.7

## FEEDBACK FROM 1/20

- **Where would you use a fork()?**
- The fork() API is used to create a new process in Linux
- **\*What is strange\*** – how new processes are created in Linux
- Instead of creating a brand-new squeaky-clean process, with an empty heap, stack, & data segments, fork() clones the existing process
- A complete copy of the parent process is made – BUT...
  - The copy is made using **COW: copy on write**
  - Memory is only cloned when data changes
- COW allows fork() to occur in a huge program, while actually doing minimal memory cloning

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.8

7

8

## FEEDBACK - 2

- **Does OS always fork the parent process? Or is there any case to fork the child process?**
- The fork() API can be called inside any process, to clone the existing process, to create a new one
- Inside a main program, you can have nested forks:
 

```
parent-fork()
  / \
parent child-1-fork()
  / \
  child-1 child-2-fork()
    / \
    child2 child3
```

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.9

## FEEDBACK - 3

- **What does the fork bomb do if it doesn't call fork() literally?**
- fork() is a C API
- In bash, the fork-bomb creates a function called ":"
- The fork bomb is
 

```
:(){ :|:&};:
```
- If we rename ":" to "funca", what we are really doing is defining a bash function call "funca":
 

```
funca() { funca | funca & };
```
- Each call to funca makes 2 more funca calls
- Each funca call is run as a separate process
  - Every command in bash is run as a separate process
- After the funca definition, funca is called (with ":")

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.10

9

10

## FEEDBACK - 4

- **How do you call a custom program with the exec APIs?**
- The same as you would call any Linux command
- It must be in the system path
- If your executable is in the present working directory, then "." must be in the path
- Check the path with:
 

```
echo $PATH
```
- If the executable is not in the path, a fully qualified pathname is required to run the executable
- The 'which' command reports what command will be run
- Myargs should always include the command and arguments

LS.17

## MULTITASKING

- How/when should the OS regain control of the CPU to switch between processes?
- **Cooperative multitasking** (mostly pre 32-bit)
  - < Windows 95, Mac OSX
- Opportunistic: running programs must give up control
  - User programs must call a special **yield** system call
  - When performing I/O
  - Illegal operations
- **(POLLEV)**  
What problems could you see with this approach?

January 22, 2026

TCSS422: Operating Systems [Winter 2026]

LS.18

17

18

## MULTITASKING

- How/when should the OS regain control of the CPU to switch between processes?
- **Cooperative multitasking** (mostly pre-32 bit)
  - A process gets stuck in an infinite loop.  
→ **Reboot the machine**
  - Operating system yields control
    - When performing I/O
    - Illegal operations
- (POLLEV)  
What problems could you see with this approach?

January 22, 2026 TCSS422: Operating Systems (Winter 2026)  
School of Engineering and Technology, University of Washington - Tacoma LS.19

19

When poll is active respond at PollEv.com/weslloyd Send weslloyd and your message to 22333

**W** What problems exist for regaining control of the CPU with cooperative multitasking OSes?

Too many processes calling yield at once?

Program has too much control over OS, too much trust to user

SEE MORE

the OS is at the mercy of whomever wrote a program

Current responses

20

## QUESTION: MULTITASKING

- What problems exist for regaining the control of the CPU with cooperative multitasking OSes?

January 22, 2026 TCSS422: Operating Systems (Winter 2026)  
School of Engineering and Technology, University of Washington - Tacoma LS.21

21

## MULTITASKING - 2

- **Preemptive multitasking** (32 & 64 bit OSes)  
■ >= Mac OSX, Windows 95+
- **Timer interrupt**
  - Raised at some regular interval (in ms)
  - **Interrupt handling**
    1. Current program is halted
    2. Program states are saved
    3. OS Interrupt handler is run (kernel mode)
- (POLLEV) What is a good interval for the timer interrupt?

January 22, 2026 TCSS422: Operating Systems (Winter 2026)  
School of Engineering and Technology, University of Washington - Tacoma LS.22

22

## MULTITASKING - 2

- **Preemptive multitasking** (32 & 64 bit OSes)  
■ >= Mac OSX, Windows 95+
- **Timer interrupt**
  - A timer interrupt gives OS the ability to run again on a CPU.
  - **Interrupt handling**
    1. Current program is halted
    2. Program states are saved
    3. OS Interrupt handler is run (kernel mode)
- (POLLEV) What is a good interval for the timer interrupt?

January 22, 2026 TCSS422: Operating Systems (Winter 2026)  
School of Engineering and Technology, University of Washington - Tacoma LS.23

23

When poll is active respond at PollEv.com/weslloyd Send weslloyd and your message to 22333

**W** For an OS that uses a system timer to force arbitrary context switches to share the CPU, what is a good value (in seconds) for the timer interrupt?

24

## QUESTION: TIME SLICE

- For an OS that uses a system timer to force arbitrary context switches to share the CPU, what is a good value (in seconds) for the timer interrupt?

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

L5.25

## QUESTION: TIME SLICE

- For an OS that uses a system timer to force arbitrary context switches to share the CPU, what is a good value (in seconds) for the timer interrupt?
  - Typical time slice for process execution is **10 to 100 milliseconds**
  - Typical context switch overhead is (switch between processes) **0.01 milliseconds**
    - 0.1% of the time slice (1/1000<sup>th</sup>)

25

26

## CHAPTER 6

- Chapter 6: Limited Direct Execution
  - Direct execution
  - Limited direct execution
  - CPU modes
  - System calls and traps
  - Cooperative multi-tasking
  - Context switching and preemptive multi-tasking**

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

L5.27

## CONTEXT SWITCH

- Preemptive multitasking initiates “trap” into the OS code to determine:
  - Whether to continue running the **current process**, or switch to a **different one**.
  - If the decision is made to switch, the OS performs a **context switch** swapping out the current process for a new one.

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

L5.28

27

28

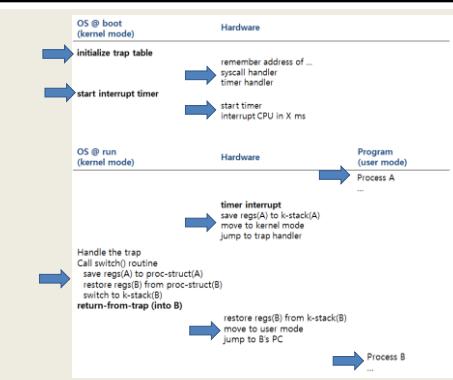

## CONTEXT SWITCH - 2

- Save register values of the current process to its kernel stack
  - General purpose registers
  - PC: program counter (instruction pointer)
  - kernel stack pointer
- Restore soon-to-be-executing process from its kernel stack
- Switch to the kernel stack for the soon-to-be-executing process

## EXTRA CREDIT SEMINAR – FRIDAY

**Research Talk:** Securing the Blindspots: From Formal Verification to Generative Verification

**Dr. Shakti Yasas Weerasinghe, Postdoctoral Research Associate at the University of Arizona**

**Friday Jan 23, 12:20pm - 1:20pm Milgard 110**

**Abstract:** This seminar explores the critical challenge of "authorization blindspots"—latent security vulnerabilities created when decentralized microservice policies diverge. Attendees will follow a research trajectory designed to detect, and validate these risks through a novel, multi-layered framework. We will first explore Automated Formal Verification, demonstrating how microservice source code can be encoded into SMT constraint models to deterministically identify end-to-end inconsistencies without manual specification. The discussion will then move to Generative Validation, illustrating how formal static analysis can be hybridized with Large Language Models. Participants will see how policy-enriched Intermediate Representations (IR) are used to guide LLMs in generating executable, downstream-aware tests that empirically validate security drifts with high semantic validity.

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.33

33

WE WILL RETURN AT ~4:55PM

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.34

34

## INTERRUPTED INTERRUPTS

**What happens if during an interrupt (trap to kernel mode), another interrupt occurs?**

**Linux**

- < 2.6 kernel: non-preemptive kernel
- ≥ 2.6 kernel: preemptive kernel

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.35

35

## PREEMPTIVE KERNEL

**Use "locks" as markers of regions of non-preemptibility (non-maskable interrupt)**

**Preemption counter (`preempt_count`)**

- begins at zero
- increments for each lock acquired (not safe to preempt)
- decrements when locks are released

**Interrupt can be interrupted when `preempt_count=0`**

- It is safe to preempt (maskable interrupt)
- the interrupt is more important

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.36

36

## OBJECTIVES – 1/22

LS.37

## CHAPTER 7- SCHEDULING: INTRODUCTION

LS.38

37

38

## SCHEDULING METRICS ★

- **Metrics:** A standard measure to quantify to what degree a system possesses some property. Metrics provide *repeatable* techniques to quantify and compare systems.
- **Measurements** are the numbers derived from the application of metrics
- **Scheduling Metric #1: Turnaround time**  
The time at which the job completes minus the time at which the job arrived in the system

$$T_{turnaround} = T_{completion} - T_{arrival}$$

- How is turnaround time different than execution time?

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.39

## SCHEDULING METRICS - 2 ★

- **Scheduling Metric #2: Fairness**
  - Jain's fairness index
  - Quantifies if jobs receive a fair share of system resources
- **n processes**
- $x_i$  is time share of each process
- worst case =  $1/n$
- best case = 1
- Consider  $n=3$ , worst case = .333, best case=1
- With  $n=3$  and  $x_1=.2$ ,  $x_2=.7$ ,  $x_3=.1$ , fairness=.62
- With  $n=3$  and  $x_1=.33$ ,  $x_2=.33$ ,  $x_3=.33$ , fairness=1

$$J(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.40

39

40

With  $n=3$  and  $x_1=.2$ ,  $x_2=.7$ ,  $x_3=.1$

$$J(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$

$$3 \cdot \frac{1}{(.2)^2 + (.7)^2 + (.1)^2} = \frac{1}{.04 + .49 + .01} = \frac{1}{.54} = .617$$

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.41

With  $n=3$  and  $x_1=.2$ ,  $x_2=.7$ ,  $x_3=.1$

$$J(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$

$$3 \cdot \frac{(.2 + .7 + .1)^2}{(.2)^2 + (.7)^2 + (.1)^2} = \frac{1}{.162} = \frac{1}{.162} = .617$$

$\frac{1}{.162} \rightarrow 1$

$$3 \cdot (.04 + .49 + .01) = 3 \cdot (.54) = 1.62$$

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.42

41

42

With n=3 and  $x_1=.33$ ,  $x_2=.33$ ,  $x_3=.33$

$$\mathcal{J}(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$

$$3 \cdot \frac{1}{(\.33^2 + .33^2 + .33^2)} = \frac{1}{.9801} = 1$$

(.1089 + .1089 + .1089)

3 (.3267)  $\frac{1}{.9801} = 1$

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.43

43

With n=3 and  $x_1=.33$ ,  $x_2=.33$ ,  $x_3=.33$

$$\mathcal{J}(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$

$$3 \cdot \frac{.33 + .33 + .33}{(.33^2 + (.33^2 + (.33^2))} = \frac{1}{.9801} = 1$$

$$3 \cdot (.1089 + .1089 + .1089)$$

$$3 \cdot (.3267) \frac{1}{.9801} = 1.002$$

(.333)<sup>2</sup> + ...

3 (.333)  $\frac{1}{.998} = 1.002$

  - Gaming the Scheduler
  - Examples

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.47

47

## SJF: SHORTEST JOB FIRST

- Given that we know execution times in advance:
  - Run in order of duration, shortest to longest
  - Non preemptive scheduler
  - This is not realistic
  - Arrival: A B C, duration a=100 sec, b/c=10sec

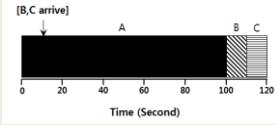

Average turnaround time =  $\frac{10 + 20 + 120}{3} = 50 \text{ sec}$

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.48

48

## SJF: WITH RANDOM ARRIVAL

- If jobs arrive at any time: duration a=100s, b/c=10s
- A @ t=0sec, B @ t=10sec, C @ t=10sec

$$\text{Average turnaround time} = \frac{100 + (110 - 10) + (120 - 10)}{3} = 103.33 \text{ sec}$$

January 22, 2026

## STCF: SHORTEST TIME TO COMPLETION FIRST

- Consider: duration a=100sec, b/c=10sec
- A<sub>len</sub>=100 A<sub>arrival</sub>=0
- B<sub>len</sub>=10, B<sub>arrival</sub>=10, C<sub>len</sub>=10, C<sub>arrival</sub>=10

$$\text{Average turnaround time} = \frac{(120 - 0) + (20 - 10) + (30 - 10)}{3} = 50 \text{ sec}$$

52

## SCHEDULING METRICS - 3

- Scheduling Metric #3: **Response Time**
- Time from when job arrives until it starts execution

$$T_{\text{response}} = T_{\text{firstrun}} - T_{\text{arrival}}$$

- STCF, SJF, FIFO
  - can perform poorly with respect to response time

What scheduling algorithm(s) can help minimize response time?

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

L5.53

School of Engineering and Technology, University of Washington - Tacoma

L5.54

53

54

## RR: ROUND ROBIN

Run each job awhile, then switch to another distributing the CPU evenly (fairly)

Scheduling Quantum is called a time slice

Time slice = 5 seconds

RR is fair, but performs poorly on metrics such as turnaround time

Round Robin scheduling algorithm Gantt chart

Scheduling Quantum = 5 seconds

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.55

55

## RR EXAMPLE

ABC arrive at time=0, each run for 5 seconds

OVERHEAD not considered

$T_{average\ response} = \frac{0 + 5 + 10}{3} = 5\ sec$

5JF (Bad for Response Time)

RR with a time-slice of 1sec (Good for Response Time)

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.56

56

## ROUND ROBIN: TRADEOFFS

Short Time Slice      Long Time Slice

Fast Response Time      Slow Response Time

High overhead from context switching      Low overhead from context switching

Time slice impact:

- Turnaround time (for earlier example):  $ts(1,2,3,4,5)=14,14,13,14,10$
- Fairness: round robin is always fair,  $J=1$

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.57

57

## SCHEDULING WITH I/O

STCF scheduler

- A: CPU=50ms, I/O=40ms, 10ms intervals
- B: CPU=50ms, I/O=0ms
- Consider A as 10ms subjobs (CPU, then I/O)

Without considering I/O:

CPU utilization= 100/140=71%

Poor Use of Resources

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.58

58

## SCHEDULING WITH I/O - 2

When a job initiates an I/O request

- A is blocked, waits for I/O to complete, frees CPU
- STCF scheduler assigns B to CPU

When I/O completes → raise interrupt

- Unblock A, STCF goes back to executing A: (10ms sub-job)

Cpu utilization = 100/100=100%

Overlap Allows Better Use of Resources

January 22, 2026 | TCSS422: Operating Systems (Winter 2026) | School of Engineering and Technology, University of Washington - Tacoma | L5.59

L5.61

61

## SCHEDULING METRICS

- Consider Three jobs (A, B, C) that require:  $time_A=400ms$ ,  $time_B=100ms$ , and  $time_C=200ms$
- All jobs arrive at time=0 in the sequence of A B C.
- Draw a scheduling graph to help compute the **average response time (ART)** and **average turnaround time (ATT)** scheduling metrics for the FIFO scheduler.

Example:

## CHAPTER 8 – MULTI-LEVEL FEEDBACK QUEUE (MLFQ) SCHEDULER

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.68

68

### OBJECTIVES – 1/22

- Questions from 1/20
- Assignment 0
- C Tutorial - Pointers, Strings, Exec in C
- Chapter 6: Limited Direct Execution
- Chapter 7: Scheduling Introduction
  - Scheduling metrics
    - Turnaround time, Jain's Fairness Index, Response time
  - FIFO, SJF, STCF, RR schedulers
- Chapter 8: Multi-level Feedback Queue
  - MLFQ Scheduler** (highlighted with a green box)
  - Job Starvation
  - Gaming the Scheduler
  - Examples

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.69

69

### MULTI-LEVEL FEEDBACK QUEUE ★

- Objectives:
  - Improve turnaround time: *Run shorter jobs first*
  - Minimize response time: *Important for interactive jobs (UI)*
- Achieve without a priori knowledge of job length

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.70

70

### MLFQ - 2 ★

- Multiple job queues
- Adjust job priority based on observed behavior
- Interactive Jobs
  - Frequent I/O → keep priority high
  - Interactive jobs require fast response time (GUI/UI)
- Batch Jobs
  - Require long periods of CPU utilization
  - Keep priority low

Round-Robin within a Queue

[High Priority] Q8 → A → B  
Q7  
Q6  
Q5  
Q4 → C  
Q3  
Q2  
[Low Priority] Q1 → D

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.71

71

### MLFQ: DETERMINING JOB PRIORITY ★

- New arriving jobs are placed into highest priority queue
- If a job uses its entire time slice, priority is reduced (↓)
  - Jobs appears CPU-bound ("batch" job), not interactive (GUI/UI)
- If a job relinquishes the CPU for I/O priority stays the same

MLFQ approximates SJF

January 22, 2026 TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma L5.72

72

## MLFQ: LONG RUNNING JOB

- Three-queue scheduler, time slice=10ms

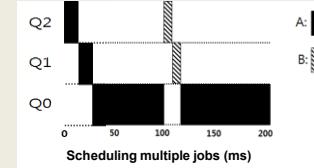

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.73

## MLFQ: BATCH AND INTERACTIVE JOBS

- $A_{arrival\_time} = 0ms, A_{run\_time} = 200ms$
- $B_{run\_time} = 20ms, B_{arrival\_time} = 100ms$

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.74

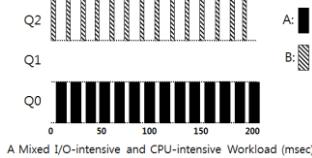

73

74

## MLFQ: BATCH AND INTERACTIVE - 2

- Continuous interactive job (B) with long running batch job (A)
  - Low response time is good for B
  - A continues to make progress

The MLFQ approach keeps interactive job(s) at the highest priority

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.75

75

LS.76

76

## MLFQ: ISSUES

### Starvation

[Low Priority]  $Q_1 \rightarrow (G) \rightarrow (H)$  CPU bound batch job(s)

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.77

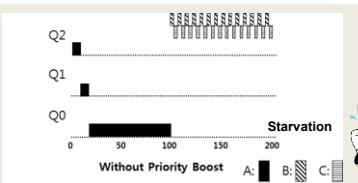

77

## RESPONDING TO BEHAVIOR CHANGE

### Priority Boost

- Reset all jobs to topmost queue after some time interval S

January 22, 2026

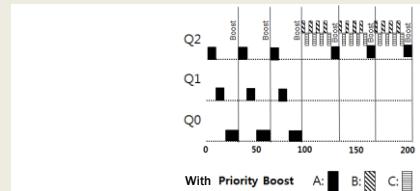

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.78

78

## RESPONDING TO BEHAVIOR CHANGE - 2

- With priority boost
- Prevents starvation

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.79

## KEY TO UNDERSTANDING MLFQ – PB

- Without priority boost:

**Rule 1:** If Priority(A) > Priority(B), A runs (B doesn't).

**Rule 2:** If Priority(A) = Priority(B), A & B run in RR.

**KEY:** If time quantum of a higher queue is filled, then we don't run any jobs in lower priority queues!!!

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.80

79

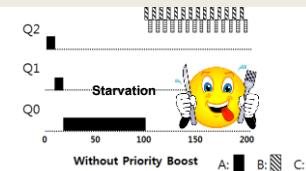

80

## STARVATION EXAMPLE

### Consider 3 queues:

- Q2 – HIGH PRIORITY – Time Quantum 10ms
- Q1 – MEDIUM PRIORITY – Time Quantum 20 ms
- Q0 – LOW PRIORITY – Time Quantum 40 ms

- Job A: 200ms no I/O
- Job B: 5ms then I/O
- Job C: 5ms then I/O
- Q2 fills up, starves Q1 & Q0
- A makes no progress

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.81

81

## OBJECTIVES – 1/22

### Questions from 1/20

- Assignment 0
- C Tutorial - Pointers, Strings, Exec in C
- Chapter 6: Limited Direct Execution
- Chapter 7: Scheduling Introduction
  - Scheduling metrics
    - Turnaround time, Jain's Fairness Index, Response time
    - FIFO, SJF, STCF, RR schedulers
- Chapter 8: Multi-level Feedback Queue
  - MLFQ Scheduler
  - Job Starvation
  - Gaming the Scheduler**
- Examples

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.82

82

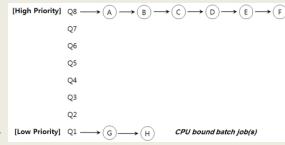

## MLFQ: ISSUES - 2

### Gaming the scheduler

- Issue I/O operation at 99% completion of the time slice
- Keeps job priority fixed – never lowered

### Job behavioral change

- CPU/batch process becomes an interactive process

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

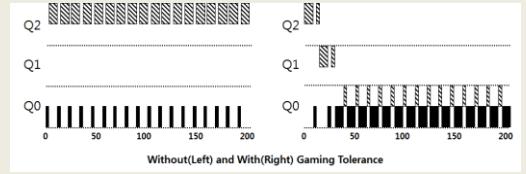

LS.83

83

## PREVENTING GAMING

### Improved time accounting:

- Track total job execution time in the queue
- Each job receives a fixed time allotment
- When allotment is exhausted, job priority is lowered

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

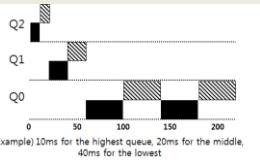

LS.84

84

## MLFQ: TUNING

### Consider the tradeoffs:

- How many queues?
- What is a good time slice?
- How often should we “Boost” priority of jobs?
- What about different time slices to different queues?

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.85

85

86

## PRACTICAL EXAMPLE

### Oracle Solaris MLFQ implementation

- 60 Queues → w/ slowly increasing time slice (high to low priority)
- Provides sys admins with set of editable table(s)
- Supports adjusting time slices, boost intervals, priority changes, etc.

### Advice

- Provide OS with hints about the process
- Nice command → Linux

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.87

87

## MLFQ RULE SUMMARY

### The refined set of MLFQ rules:

- **Rule 1:** If Priority(A) > Priority(B), A runs (B doesn't).
- **Rule 2:** If Priority(A) = Priority(B), A & B run in RR.
- **Rule 3:** When a job enters the system, it is placed at the highest priority.
- **Rule 4:** Once a job uses up its time allotment at a given level (regardless of how many times it has given up the CPU), its priority is reduced(i.e., it moves down on queue).
- **Rule 5:** After some time period S, move all the jobs in the system to the topmost queue.

January 22, 2026

TCSS422: Operating Systems [Winter 2026]  
School of Engineering and Technology, University of Washington - Tacoma

LS.88

88

Jackson deploys a 3-level MLFQ scheduler. The time slice is 1 for high priority jobs, 2 for medium priority, and 4 for low priority. This MLFQ scheduler performs a Priority Boost every 6 timer units. When the priority boost fires, the current job is preempted, and the next scheduled job is run in round-robin order.

Job	Arrival Time	Job Length
A	T=0	4
B	T=0	16
C	T=0	8

(11 points) Show a scheduling graph for the MLFQ scheduler for the jobs above. Draw vertical lines for key events and be sure to label the X-axis times as in the example. Please draw clearly. An unreadable graph will lose points.

89

## EXAMPLE

### Question:

- Given a system with a quantum length of 10 ms in its highest queue, how often would you have to boost jobs back to the highest priority level to guarantee that a single long-running (and potentially starving) job gets at least 5% of the CPU?

- Some combination of n short jobs runs for a total of 10 ms per cycle without relinquishing the CPU

- E.g. 2 jobs = 5 ms ea; 3 jobs = 3.33 ms ea, 10 jobs = 1 ms ea
- n jobs always uses full time quantum (10 ms)
- Batch jobs starts, runs for full quantum of 10ms
- All other jobs run and context switch totaling the quantum per cycle
- If 10ms is 5% of the CPU, when must the priority boost be ???

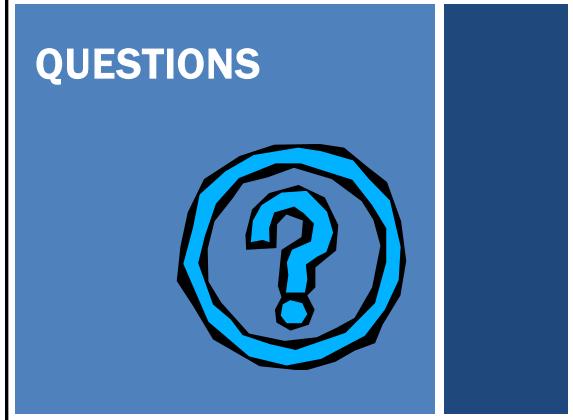

▪ **ANSWER** → Priority boost should occur every 200ms

January 22, 2026
