

	FEEDBACK - 5		
Use of fork()			
 How do parent and child processes interact with each other? The parent starts the child, and can wait() until it finishes. Nothing prevents the parent from exiting while a child continues to execute – they are separate processes 			
 Can you give a scenario in which forks might be preferred to threads, even though they seem to be less efficient? Writing a "shell" fork to run user commands Any program that launches an entirely separate program
