

TCSS 422: OPERATING SYSTEMS

**Three Easy Pieces:
CVs, Concurrency Problems,
Intro to Memory Virtualization**

Wes J. Lloyd
Institute of Technology
University of Washington - Tacoma

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

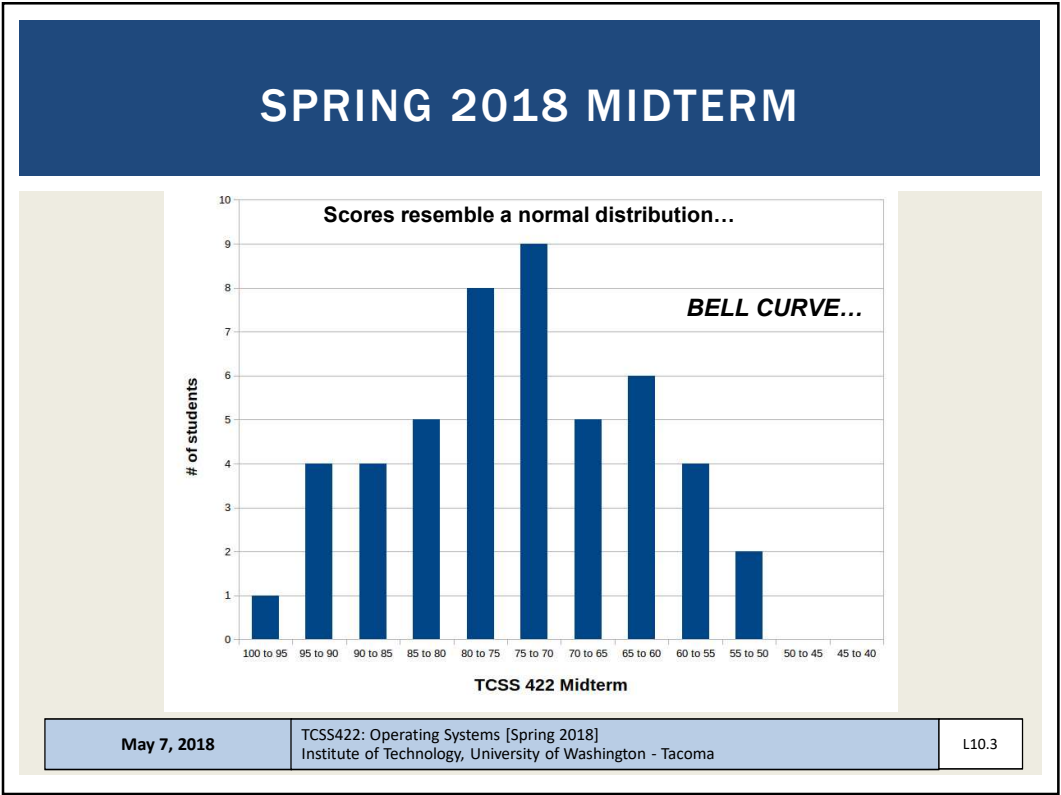

OBJECTIVES

- Midterm Review
- Assignment 2 – Matrix Task Processor
- Condition Variables – Ch. 30
- Concurrency Problems – Ch. 32
- Memory Virtualization is next...
- Address Spaces – Ch. 13
- Memory API – Ch. 14
- Address Translation – Ch. 15
- Segmentation – Ch. 15

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.2

CHAPTER 30 – CONDITION VARIABLES

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.5

CONDITION VARIABLES

- Support a signaling mechanism to alert threads when preconditions have been satisfied
- Eliminate busy waiting
- Alert one or more threads to “consume” a result, or respond to state changes in the application
- Threads are placed on an **explicit queue** (FIFO) to wait for signals
- **Signal**: wakes one thread
broadcast wakes all (ordering by the OS)

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.6

CONDITION VARIABLES - 3

- **Condition variable**

```
pthread_cond_t c;
```

- **Requires initialization**

- **Condition API calls**

```
pthread_cond_wait(pthread_cond_t *c, pthread_mutex_t *m); // wait()  
pthread_cond_signal(pthread_cond_t *c); // signal()
```

- **wait() accepts a mutex parameter**

- **Releases lock, puts thread to sleep**

- **signal()**

- **Wakes up thread, awakening thread acquires lock**

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.7

MATRIX GENERATOR

Matrix generation example

Chapter 30
signal.c

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.8

SUBTLE RACE CONDITION: WITHOUT A WHILE

```
1  void thr_exit() {
2      done = 1;
3      pthread_cond_signal(&c);
4  }
5
6  void thr_join() {
7      if (done == 0)
8          pthread_cond_wait(&c);
9  }
```

- Parent thread calls `thr_join()` and executes the comparison
- The context switches to the child
- The child runs `thr_exit()` and signals the parent, but the parent is not waiting yet.
- The signal is lost
- The parent deadlocks

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.9

PRODUCER / CONSUMER

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.10

PRODUCER / CONSUMER

■ Producer

- Produces items – consider the child matrix maker
- Places them in a buffer
 - Example: the buffer is only 1 element (single array pointer)

■ Consumer

- Grabs data out of the buffer
- Our example: parent thread receives dynamically generated matrices and performs an operation on them
 - Example: calculates average value of every element (integer)

■ Multithreaded web server example

- Http requests placed into work queue; threads process

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.11

PRODUCER / CONSUMER - 2

■ Producer / Consumer is also known as **Bounded Buffer**

■ Bounded buffer

- Similar to piping output from one Linux process to another
- `grep pthread signal.c | wc -l`
- Synchronized access:
sends output from `grep` → `wc` as it is produced
- File stream

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.12

PUT/GET ROUTINES

- Buffer is a one element shared data structure (int)
- Producer “puts” data
- Consumer “gets” data
- Shared data structure requires synchronization

```

1  int buffer;
2  int count = 0;  // initially, empty
3
4  void put(int value) {
5      assert(count == 0);
6      count = 1;
7      buffer = value;
8  }
9
10 int get() {
11     assert(count == 1);
12     count = 0;
13     return buffer;
14 }
```

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.13

PRODUCER / CONSUMER - 3

- Producer adds data
- Consumer removes data (busy waiting)
- Will this code work (spin locks) with 2-threads?

1. Producer 2. Consumer

```

1  void *producer(void *arg) {
2      int i;
3      int loops = (int) arg;
4      for (i = 0; i < loops; i++) {
5          put(i);
6      }
7  }
8
9  void *consumer(void *arg) {
10     int i;
11     while (1) {
12         int tmp = get();
13         printf("%d\n", tmp);
14     }
15 }
```

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.14

PRODUCER / CONSUMER - 3

- The shared data structure needs synchronization!

```

1  cond_t cond;
2  mutex_t mutex;
3
4  void *producer(void *arg) {
5      int i;
6      for (i = 0; i < loops; i++) {
7          pthread_mutex_lock(&mutex);          // p1
8          if (count == 1)                      // p2
9              pthread_cond_wait(&cond, &mutex); // p3
10         put(i);                               // p4
11         pthread_cond_signal(&cond);           // p5
12         pthread_mutex_unlock(&mutex);         // p6
13     }
14 }
15
16 void *consumer(void *arg) {
17     int i;
18     for (i = 0; i < loops; i++) {
19         pthread_mutex_lock(&mutex);           // c1

```

May 7, 2018

TCS5422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.15

PRODUCER/CONSUMER - 4

```

20         if (count == 0)                      // c2
21             pthread_cond_wait(&cond, &mutex); // c3
22         int tmp = get();                      // c4
23         pthread_cond_signal(&cond);           // c5
24         pthread_mutex_unlock(&mutex);         // c6
25         printf("%d\n", tmp);
26     }
27 }

```

Consumer

- This code as-is works with just:
 - (1) Producer
 - (1) Consumer
- If we scale to (2+) consumer's it fails
 - How can it be fixed ?

L10.17

PRODUCER/CONSUMER
SYNCHRONIZATION

■ When producer threads awake, they do not check if there is any data in the buffer...

■ Need while, not if

■ What if T_p puts a value, wakes T_{c1} whom consumes the value

■ Then T_p has a value to put, but T_{c1}'s signal on &cond wakes T_{c2}

■ There is nothing for T_{c2} consume, so T_{c2} sleeps

■ T_{c1}, T_{c2}, and T_p all sleep forever

■ T_{c1} needs to wake T_p to T_{c2}

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.20

TWO CONDITIONS

- Use two condition variables: empty & full
 - One condition handles the producer
 - the other the consumer

```

1  cond_t empty, full;
2  mutex_t mutex;
3
4  void *producer(void *arg) {
5      int i;
6      for (i = 0; i < loops; i++) {
7          pthread_mutex_lock(&mutex);
8          while (count == 1)
9              pthread_cond_wait(&empty, &mutex);
10         put(i);
11         pthread_cond_signal(&full);
12         pthread_mutex_unlock(&mutex);
13     }
14 }
15

```

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.21

FINAL PRODUCER/CONSUMER

- Change buffer from int, to int buffer[MAX]
- Add indexing variables

```

1  int buffer[MAX];
2  int fill = 0;
3  int use = 0;
4  int count = 0;
5
6  void put(int value) {
7      buffer[fill] = value;
8      fill = (fill + 1) % MAX;
9      count++;
10 }
11
12 int get() {
13     int tmp = buffer[use];
14     use = (use + 1) % MAX;
15     count--;
16     return tmp;
17 }

```

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.22

FINAL P/C - 2

```

1  cond_t empty, full;
2  mutex_t mutex;
3
4  void *producer(void *arg) {
5      int i;
6      for (i = 0; i < loops; i++) {
7          pthread_mutex_lock(&mutex);           // p1
8          while (count == MAX)                  // p2
9              pthread_cond_wait(&empty, &mutex); // p3
10         put(i);                               // p4
11         pthread_cond_signal(&full);           // p5
12         pthread_mutex_unlock(&mutex);         // p6
13     }
14 }
15
16 void *consumer(void *arg) {
17     int i;
18     for (i = 0; i < loops; i++) {
19         pthread_mutex_lock(&mutex);           // c1
20         while (count == 0)                    // c2
21             pthread_cond_wait(&full, &mutex); // c3
22         int tmp = get();                      // c4

```

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.23

FINAL P/C - 3

```

(Cont.)
23     pthread_cond_signal(&empty);           // c5
24     pthread_mutex_unlock(&mutex);          // c6
25     printf("%d\n", tmp);
26 }
27

```

- Producer: only sleeps when buffer is full
- Consumer: only sleeps if buffers are empty

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.24

COVERING CONDITIONS

- A condition that covers all cases (conditions):
- Excellent use case for `pthread_cond_broadcast`
- Consider memory allocation:
 - When a program deals with huge memory allocation/deallocation on the heap
 - Access to the heap must be managed when memory is scarce

PREVENT: Out of memory:
- queue requests until memory is free

- Which thread should be woken up?

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.25

COVERING CONDITIONS - 2

```

1 // how many bytes of the heap are free?
2 int bytesLeft = MAX_HEAP_SIZE;
3
4 // need lock and condition too
5 cond_t c;
6 mutex_t m;
7
8 void *
9 allocate(int size) {
10     pthread_mutex_lock(&m);
11     while (bytesLeft < size)
12         pthread_cond_wait(&c, &m);
13     void *ptr = ...; // get mem from heap
14     bytesLeft -= size;
15     pthread_mutex_unlock(&m);
16     return ptr;
17 }
18
19 void free(void *ptr, int size) {
20     pthread_mutex_lock(&m);
21     bytesLeft += size;
22     pthread_cond_signal(&c); // Broadcast
23     pthread_mutex_unlock(&m);
24 }
```

Check available memory

Broadcast

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.26

COVER CONDITIONS - 3

- Broadcast awakens all blocked threads requesting memory
- Each thread evaluates if there's enough memory: (`bytesLeft < size`)
 - Reject: requests that cannot be fulfilled- go back to sleep
 - *Insufficient memory*
 - Run: requests which can be fulfilled
 - with newly available memory!
- Overhead
 - Many threads may be awoken which can't execute

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.27

CHAPTER 32 – CONCURRENCY PROBLEMS

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.28

OBJECTIVES

- **Chapter 32:**
 - Non-deadlock concurrency bugs
 - Deadlock causes
 - Deadlock prevention

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.29

CONCURRENCY BUGS IN OPEN SOURCE SOFTWARE

- “Learning from Mistakes – A Comprehensive Study on Real World Concurrency Bug Characteristics”
 - Shan Lu et al.
 - Architectural Support For Programming Languages and Operating Systems (ASPLOS 2008), Seattle WA

Application	What it does	Non-Deadlock	Deadlock
MySQL	Database Server	14	9
Apache	Web Server	13	4
Mozilla	Web Browser	41	16
Open Office	Office Suite	6	2
Total		74	31

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.30

NON-DEADLOCK BUGS

- Majority of concurrency bugs
- Most common:
 - Atomicity violation: forget to use locks
 - Order violation: failure to initialize lock/condition before use

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.31

ATOMICITY VIOLATION - MYSQL

- Two threads access the `proc_info` field in `struct thd`
- `NULL` is 0 in C
- Serialized access to shared memory among separate threads is not enforced (e.g. non-atomic)
- Simple example:

Programmer intended
variable to be accessed
atomically...

```
1  Thread1::  
2  if(thd->proc_info){  
3      ...  
4      fputs(thd->proc_info , ...);  
5      ...  
6  }  
7  
8  Thread2::  
9  thd->proc_info = NULL;
```

May 7, 2018

TCCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.32

ATOMICITY VIOLATION - SOLUTION

- Add locks for all uses of: `thd->proc_info`

```

1  pthread_mutex_t lock = PTHREAD_MUTEX_INITIALIZER;
2
3  Thread1:
4  pthread_mutex_lock(&lock);
5  if(thd->proc_info){
6      ...
7      fputs(thd->proc_info , ...);
8      ...
9  }
10 pthread_mutex_unlock(&lock);
11
12 Thread2:
13 pthread_mutex_lock(&lock);
14 thd->proc_info = NULL;
15 pthread_mutex_unlock(&lock);
    
```

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.33

ORDER VIOLATION BUGS

- Desired order between memory accesses is flipped
- E.g. something is checked before it is set
- Example:

```

1  Thread1:
2  void init(){
3      mThread = PR_CreateThread(mMain, ...);
4  }
5
6  Thread2:
7  void mMain(...){
8      mState = mThread->State
9  }
    
```

- What if `mThread` is not initialized?

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.34

ORDER VIOLATION - SOLUTION

■ Use condition variable to enforce order

```

1  pthread_mutex_t mtLock = PTHREAD_MUTEX_INITIALIZER;
2  pthread_cond_t mtCond = PTHREAD_COND_INITIALIZER;
3  int mtInit = 0;
4
5  Thread1::
6  void init(){
7      ...
8      mThread = PR_CreateThread(mMain,...);
9
10     // signal that the thread has been created.
11     pthread_mutex_lock(&mtLock);
12     mtInit = 1;
13     pthread_cond_signal(&mtCond);
14     pthread_mutex_unlock(&mtLock);
15     ...
16 }
17
18 Thread2::
19 void mMain(...) {
20     ...

```

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.35

ORDER VIOLATION – SOLUTION 2

```

21     // wait for the thread to be initialized ...
22     pthread_mutex_lock(&mtLock);
23     while(mtInit == 0)
24         pthread_cond_wait(&mtCond, &mtLock);
25     pthread_mutex_unlock(&mtLock);
26
27     mState = mThread->State;
28     ...
29 }

```

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.36

NON-DEADLOCK BUGS - 1

- 97% of Non-Deadlock Bugs were
 - Atomicity
 - Order violations
- Consider what is involved in “spotting” these bugs in code
- Desire for automated tool support (IDE)

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.37

NON-DEADLOCK BUGS - 2

- Atomicity
 - How can we tell if a given variable is shared?
 - Can search the code for uses
 - How do we know if all instances of its use are shared?
 - Can some non-synchronized (non-atomic) uses be legal?
 - Before threads are created, after threads exit
 - Must verify the scope
- Order violation
 - Must consider all variable accesses
 - Must know desired order

May 7, 2018

TCS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.38

DEADLOCK BUGS

- Presence of a cycle in code
- Thread 1 acquires lock L1, waits for lock L2
- Thread 2 acquires lock L2, waits for lock L1

```
Thread 1:      Thread 2:
lock (L1);      lock (L2);
lock (L2);      lock (L1);
```

- Both threads can block, unless one manages to acquire both locks

May 7, 2018

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.39

REASONS FOR DEADLOCKS

- Complex code
 - Must avoid circular dependencies – can be hard to find...
- Encapsulation hides potential locking conflicts
 - Easy-to-use APIs embed locks inside
 - Programmer doesn't know they are there
 - Consider the Java Vector class:

```
1  Vector v1,v2;
2  v1.AddAll(v2);
```

- Vector is thread safe (synchronized) by design
- If there is a v2.AddAll(v1); call at nearly the same time deadlock could result

L10.40

CONDITIONS FOR DEADLOCK

- Four conditions are required for dead lock to occur

Condition	Description
Mutual Exclusion	Threads claim exclusive control of resources that they require.
Hold-and-wait	Threads hold resources allocated to them while waiting for additional resources
No preemption	Resources cannot be forcibly removed from threads that are holding them.
Circular wait	There exists a circular chain of threads such that each thread holds one more resources that are being requested by the next thread in the chain

L10.41

PREVENTION – MUTUAL EXCLUSION

- Build wait-free data structures
 - Eliminate locks altogether
 - Build structures using CompareAndSwap atomic CPU (HW) instruction
- C pseudo code for CompareAndSwap
- Hardware executes this code atomically

```

1  int CompareAndSwap(int *address, int expected, int new) {
2      if(*address == expected){
3          *address = new;
4          return 1; // success
5      }
6      return 0;
7  }
```

L10.42

PREVENTION – MUTUAL EXCLUSION - 2

- Recall atomic increment

```
1 void AtomicIncrement(int *value, int amount){
2     do{
3         int old = *value;
4     }while( CompareAndSwap(value, old, old+amount)==0);
5 }
```

- Compare and Swap tries over and over until successful
- CompareAndSwap is guaranteed to be atomic
- When it runs it is **ALWAYS** atomic (at HW level)

L10.43

MUTUAL EXCLUSION: LIST INSERTION

- Consider list insertion

```
1 void insert(int value){
2     node_t * n = malloc(sizeof(node_t));
3     assert( n != NULL );
4     n->value = value ;
5     n->next = head;
6     head    = n;
7 }
```

L10.44

MUTUAL EXCLUSION – LIST INSERTION - 2

■ Lock based implementation

```
1 void insert(int value){
2     node_t * n = malloc(sizeof(node_t));
3     assert( n != NULL );
4     n->value = value ;
5     lock(listlock); // begin critical section
6     n->next = head;
7     head = n;
8     unlock(listlock) ; //end critical section
9 }
```

TCSS422: Operating Systems [Spring 2018]
Institute of Technology, University of Washington - Tacoma

L10.45

MUTUAL EXCLUSION – LIST INSERTION - 3

■ Wait free (no lock) implementation

```
1 void insert(int value) {
2     node_t *n = malloc(sizeof(node_t));
3     assert(n != NULL);
4     n->value = value;
5     do {
6         n->next = head;
7     } while (!CompareAndSwap(&head, n->next, n));
8 }
```

- Assign &head to n (new node ptr)
- Only when head = n->next
