## OBJECTIVES – 4/27

- **Questions from 4/25**
- C Tutorial - Pointers, Strings, Exec in C - Due Fri Apr 28
- Assignment 1 - Due Tue May 9
- Quiz 1 (Due Thur Apr 27) – Quiz 2 (Due Tue May 2)
- Chapter 27: Linux Thread API
  - pthread\_cond\_wait/\_signal/\_broadcast
- Chapter 28: Locks
  - Introduction, Lock Granularity
  - Spin Locks, Test and Set, Compare and Swap
- Chapter 29: Lock Based Data Structures
  - Approximate Counter (Sloppy Counter)
  - Concurrent Structures: Linked List, Queue, Hash Table

April 27, 2023	TCSS422: Operating Systems [Spring 2023] School of Engineering and Technology, University of Washington - Tacoma	L10.2

TCSS 422 - Online Daily Feedback Survey - 4/1

Quiz Instructions

Question 1

0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

12345678910

Mostly Review To MeEqual New and ReviewMostly New to Me

Question 2

0.5 pts

Please rate the pace of today's class:

12345678910

SlowJust RightFast

April 27, 2023

TCSS422: Computer Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.4

4

MATERIAL / PACE

- Please classify your perspective on material covered in today’s class (40 respondents):
  - 1-mostly review, 5-equal new/review, 10-mostly new
  - **Average – 7.30 (↓ - previous 7.44)**
- Please rate the pace of today’s class:
  - 1-slow, 5-just right, 10-fast
  - **Average – 5.70 (↓ - previous 5.84)**

FEEDBACK FROM 4/25

- ***In what situations would it be useful to provide attributes different from the defaults for pthread\_create?***
- pthread\_attr\_init() initializes a pthread attribute type
- The type is pthread\_attr\_t
- Once the type is initialized, there is an API to configure the attr record
- API functions:
  - pthread\_attr\_setaffinity\_np(), pthread\_attr\_setdetachstate(), pthread\_attr\_setguardsize(), pthread\_attr\_setinheritsched(), pthread\_attr\_setschedparam(), pthread\_attr\_setschedpolicy(), pthread\_attr\_setscope(), pthread\_attr\_setstack(), pthread\_attr\_setstackaddr(), pthread\_attr\_setstacksize(), pthread\_getattr\_np(), pthread\_setattr\_default\_np()
- See man pages for more info on this API

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.6

6

FEEDBACK - 2

- *In what situations would it be useful to provide attributes different from the defaults for pthread\_mutex\_init?*
- From the man pages:
- pthread\_mutexattr\_init() initializes a mutex attribute type
- The type is pthread\_mutexattr\_t
- LinuxThreads supports only one mutex attribute: the mutex kind
  - PTHREAD\_MUTEX\_FAST\_NP for 'fast' mutexes
  - PTHREAD\_MUTEX\_RECURSIVE\_NP for 'recursive' mutexes
  - PTHREAD\_MUTEX\_ERRORCHECK\_NP for 'error checking' mutexes
  - NP indicates these are non-portable extensions to the standard.
- The kind determines what happens if a thread attempts to lock a mutex it already owns with pthread\_mutex\_lock().
- The default mutex kind is PTHREAD\_MUTEX\_FAST\_NP ('fast').

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.7

7

FEEDBACK - 3

- *(CONTINUED) In what situations would it be useful to provide attributes different from the defaults for pthread\_mutex\_init?*
- If the mutex is of the 'fast' kind, pthread\_mutex\_lock() simply suspends the calling thread forever.
- If the mutex is of the 'recursive' kind, the call to pthread\_mutex\_lock() returns immediately with a success return code. The number of times the thread owning the mutex has locked it is recorded in the mutex. The owning thread must call pthread\_mutex\_unlock() the same number of times before the mutex returns to the unlocked state.
- If the mutex is of the 'error checking' kind, pthread\_mutex\_lock() returns immediately with the error code EDEADLK.

School of Engineering and Technology, University of Washington - Tacoma

L10.8

8

## FEEDBACK - 4

- **With different purposes, each type of thread will be used in different scenarios, isn't it?**
- **REINTERPRETATION :**
- **For what different purposes will each type of thread be used in?**
  - Not clear what is meant by “each type of thread”
  - Is this referring to threads vs. processes?
  - Is this referring to threads with different INIT attributes?

## CONDITIONS AND SIGNALS

- Condition variables support “signaling” between threads

```
int pthread_cond_wait(pthread_cond_t *cond,  
                      pthread_mutex_t *mutex);  
int pthread_cond_signal(pthread_cond_t *cond);
```

- pthread\_cond\_t datatype
- pthread\_cond\_wait()
  - Puts thread to “sleep” (waits) (THREAD is BLOCKED)
  - Threads added to >FIFO queue<, lock is released
  - Waits (*listens*) for a “signal” (NON-BUSY WAITING, no polling)
  - When signal occurs, interrupt fires, wakes up first thread, (THREAD is RUNNING), lock is provided to thread

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.16

16

## CONDITIONS AND SIGNALS - 2

```
int pthread_cond_signal(pthread_cond_t * cond);  
int pthread_cond_broadcast(pthread_cond_t * cond);
```

- `pthread_cond_signal()`
  - Called to send a “signal” to wake-up first thread in **FIFO “wait” queue**
  - The goal is to unblock a thread to respond to the signal
- `pthread_cond_broadcast()`
  - Unblocks all threads in **FIFO “wait” queue**, currently blocked on the specified condition variable
  - Broadcast is used when all threads should wake-up for the signal
- Which thread is unblocked first?
  - Determined by OS scheduler (based on priority)
  - Thread(s) awoken based on placement order in **FIFO wait queue**
  - When awoken threads acquire lock as in `pthread_mutex_lock()`

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.17

17

## CONDITIONS AND SIGNALS - 3

- Wait example:

```
pthread_mutex_t lock = PTHREAD_MUTEX_INITIALIZER;  
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;  
  
pthread_mutex_lock(&lock);  
while (initialized == 0)  
    pthread_cond_wait(&cond, &lock);  
// Perform work that requires lock  
a = a + b;  
pthread_mutex_unlock(&lock);
```

- `wait` puts thread to sleep, releases lock
- when awoken, lock reacquired (but then released by this code)
- When initialized, another thread signals

```
pthread_mutex_lock(&lock);  
initialized = 1;  
pthread_cond_signal(&cond);  
pthread_mutex_unlock(&lock);
```

State variable set,  
Enables other thread(s)  
to proceed above.

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.18

18

## CONDITION AND SIGNALS - 4

```
pthread_mutex_t lock = PTHREAD_MUTEX_INITIALIZER;  
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;  
  
pthread_mutex_lock(&lock);  
while (initialized == 0)  
    pthread_cond_wait(&cond, &lock);  
// Perform work that requires lock  
a = a + b;  
pthread_mutex_unlock(&lock);
```

- Why do we wait inside a while loop?
- The while ensures upon awakening the condition is rechecked
  - A signal is raised, but the pre-conditions required to proceed may have not been met. **\*\*MUST CHECK STATE VARIABLE\*\***
  - Without checking the state variable the thread may proceed to execute when it should not. (e.g. too early)

L10.19

19

## PTHREADS LIBRARY

- **Compilation:**  
gcc requires special option to require programs with pthreads:
  - gcc -pthread pthread.c -o pthread
  - Explicitly links library with compiler flag
  - **RECOMMEND:** using makefile to provide compiler arguments
- **List of pthread manpages**
  - man -k pthread
  - May need to install Linux package for pthread API documentation:
    - sudo apt install glibc-doc

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.20

20

SAMPLE MAKEFILE

```
CC=gcc
CFLAGS=-pthread -I. -Wall

binaries=pthread pthread_int pthread_lock_cond pthread_struct

all: $(binaries)

pthread_mult: pthread.c pthread_int.c
    $(CC) $(CFLAGS) $^ -o $@

clean:
    $(RM) -f $(binaries) *.o
```

- Example builds multiple single file programs
  - All target
- pthread\_mult
  - Example if multiple source files should produce a single executable
- clean target

W

What key feature differentiates condition variables from mutex\_locks in C ?

Condition variables provide only NON-BLOCKING API calls.

Locks can not be used without condition variables.

Condition variables introduce a FIFO queue enabling control of the order that threads will receive the lock which provides fairness.

Condition variables must first be initialized to a non-NULL value before being used in the program.

None of the above

CHAPTER 28 –  
LOCKS

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.2  
4

24

# LOCKS

- Ensure critical section(s) are executed atomically-as a *unit*
  - Only one thread is allowed to execute a critical section at any given time
  - Ensures the code snippets are “mutually exclusive”
- Protect a global counter:

```
balance = balance + 1;
```
- A “critical section”:

```
1 lock_t mutex; // some globally-allocated lock 'mutex'
2 ...
3 lock(&mutex);
4 balance = balance + 1;
5 unlock(&mutex);
```

April 27, 2023	TCSS422: Operating Systems [Spring 2023] School of Engineering and Technology, University of Washington - Tacoma	L10.25
----------------	---	--------

25

# LOCKS - 2

- Lock variables are called “MUTEX”
  - Short for mutual exclusion (that’s what they guarantee)
- Lock variables store the state of the lock
- States
  - **Locked** (acquired or held)
  - **Unlocked** (available or free)
- Only 1 thread can hold a lock

April 27, 2023	TCSS422: Operating Systems [Spring 2023] School of Engineering and Technology, University of Washington - Tacoma	L10.26
----------------	---	--------

26

## LOCKS - 3

- `pthread_mutex_lock(&lock)`
  - Try to acquire lock
  - If lock is free, calling thread will acquire the lock
  - Thread with lock enters critical section
    - Thread “owns” the lock
- No other thread can acquire the lock before the owner releases it.

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.27

School of Engineering and Technology, University of Washington - Tacoma

L10.28

28

## LOCKS - 4

- Program can have many mutex (lock) variables to “serialize” many critical sections
- Locks are also used to protect data structures
  - Prevent multiple threads from changing the same data simultaneously
  - Programmer can make sections of code “granular”
    - **Fine grained** – means just one grain of sand at a time through an hour glass
  - Similar to relational database transactions
    - DB transactions prevent multiple users from modifying a table, row, field

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

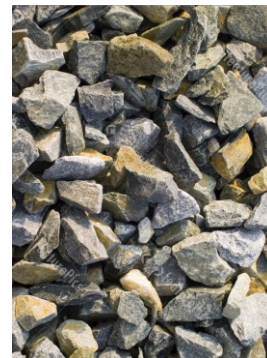

L10.29

29

## FINE GRAINED?

- ***Is this code a good example of “fine grained parallelism”?***

```
pthread_mutex_lock(&lock);  
a = b++;  
b = a * c;  
*d = a + b + c;  
FILE * fp = fopen ("file.txt", "r");  
fscanf(fp, "%s %s %s %d", str1, str2, str3, &e);  
ListNode *node = mylist->head;  
Int i=0  
while (node) {  
    node->title = str1;  
    node->subheading = str2;  
    node->desc = str3;  
    node->end = *e;  
    node = node->next;  
    i++  
}  
e = e - i;  
pthread_mutex_unlock(&lock);
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.30

30

FINE GRAINED PARALLELISM

```
pthread_mutex_lock(&lock_a);
pthread_mutex_lock(&lock_b);
a = b++;
pthread_mutex_unlock(&lock_b);
pthread_mutex_unlock(&lock_a);

pthread_mutex_lock(&lock_b);
b = a * c;
pthread_mutex_unlock(&lock_b);

pthread_mutex_lock(&lock_d);
*d = a + b + c;
pthread_mutex_unlock(&lock_d);

FILE * fp = fopen ("file.txt", "r");
pthread_mutex_lock(&lock_e);
fscanf(fp, "%s %s %s %d", str1, str2, str3, &e);
pthread_mutex_unlock(&lock_e);

ListNode *node = mylist->head;
int i=0 . . .
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.31

31

LOCK GRANULARITY TRADE-OFF SPACE

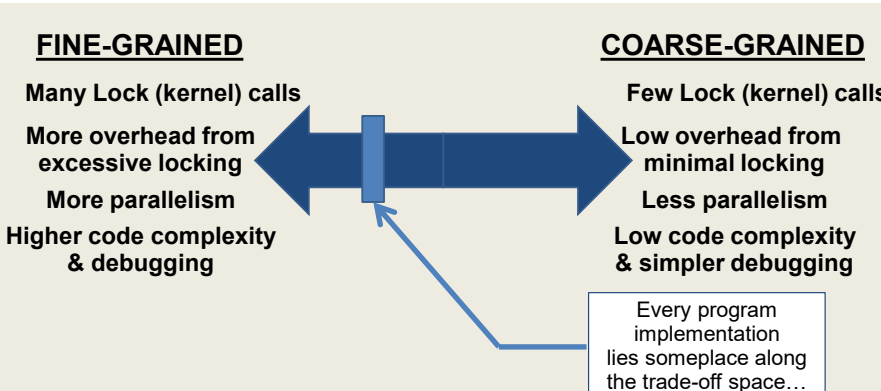

**FINE-GRAINED**

Many Lock (kernel) calls

More overhead from excessive locking

More parallelism

Higher code complexity & debugging

**COARSE-GRAINED**

Few Lock (kernel) calls

Low overhead from minimal locking

Less parallelism

Low code complexity & simpler debugging

Every program implementation lies someplace along the trade-off space...

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L4.32

32

## EVALUATING LOCK IMPLEMENTATIONS

### ■ Correctness

- Does the lock work?
- Are critical sections mutually exclusive?  
(atomic-as a unit?)

What makes a  
good lock?

### ■ Fairness

- Do all threads that compete for a lock have a fair chance of acquiring it?

### ■ Overhead

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.33

33

## BUILDING LOCKS

### ■ Locks require hardware support

- To minimize overhead, ensure fairness and correctness
- Special “atomic-as a unit” instructions to support lock implementation
- Atomic-as a unit exchange instruction
  - XCHG
- Compare and exchange instruction
  - CMPXCHG
  - CMPXCHG8B
  - CMPXCHG16B

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.34

34

# HISTORICAL IMPLEMENTATION

- To implement mutual exclusion
  - Disable interrupts upon entering critical sections

```
1 void lock() {  
2     DisableInterrupts();  
3 }  
4 void unlock() {  
5     EnableInterrupts();  
6 }
```

- Any thread could disable system-wide interrupt
  - What if lock is never released?
- On a multiprocessor processor each CPU has its own interrupts
  - Do we disable interrupts for all cores simultaneously?
- While interrupts are disabled, they could be lost
  - If not queued...

## BASIC SPIN LOCK IMPLEMENTATION

- Demonstration of lock implementation using C code
- C code is compiled to assembly, instructions are not atomic
- Idea is to imagine “what if” the lock code were atomic

- Is this lock implementation:  
(1)Correct?  
(2)Fair?  
(3)Performant?

```
1  typedef struct __lock_t { int flag; } lock_t;
2
3  void init(lock_t *mutex) {
4      // 0 → lock is available, 1 → held
5      mutex->flag = 0;
6  }
7
8  void lock(lock_t *mutex) {
9      while (mutex->flag == 1) // TEST the flag
10         ; // spin-wait (do nothing)
11     mutex->flag = 1; // now SET it !
12 }
13
14 void unlock(lock_t *mutex) {
15     mutex->flag = 0;
16 }
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.38

38

## BASIC SPIN LOCK: CORRECT?

- If both threads can run at the same time, then correctness requires luck... (e.g. *basic spin lock is incorrect*)

Thread1	Thread2
<pre>call lock() while (flag == 1) interrupt: switch to Thread 2</pre>	<pre>call lock() while (flag == 1) flag = 1; interrupt: switch to Thread 1</pre>
<pre>flag = 1; // set flag to 1 (too!)</pre>	

- Here both threads have “acquired” the lock simultaneously

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.39

39

## BASIC SPIN LOCK: PERFORMANCE ?

```
void lock(lock_t *mutex)
{
    while (mutex->flag == 1); // while lock is unavailable, wait...
    mutex->flag = 1;
}
```

- What is wrong with while(<cond>); ?
- Spin-waiting wastes time actively waiting for another thread
- while (1); will “peg” a CPU core at 100%
  - Continuously loops, and evaluates mutex->flag value...
  - If multiple threads wait for the CPU, more CPU capacity is wasted
  - Generates heat...

## TEST-AND-SET INSTRUCTION

- Hardware support required for working locks
- Book presents pseudo code of C implementation for TEST-AND-SET instruction that needs to be atomic
  - TEST-and-SET checks old value improving on basic spin lock
  - TEST-and-SET returns the old value so it can be checked
  - Comparison is made in the caller
  - Assumption is the TEST-AND-SET routine runs atomically on the CPU
  - Here is the C-pseudo code:

```
1  int TestAndSet(int *ptr, int new) {
2      int old = *ptr; // fetch old value at ptr
3      *ptr = new;     // store 'new' into ptr
4      return old;     // return the old value
5  }
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.42

42

## TEST-AND-SET - 2

- `lock()` method checks that `TestAndSet` doesn't return 1
- If `TestAndSet` returns 1:
  - This indicates someone else has the lock

```
1  typedef struct __lock_t {
2      int flag;
3  } lock_t;
4
5  void init(lock_t *lock) {
6      // 0 indicates that lock is available,
7      // 1 that it is held
8      lock->flag = 0;
9  }
10
11 void lock(lock_t *lock) {
12     while (TestAndSet(&lock->flag, 1) == 1)
13         ; // spin-wait
14 }
15
16 void unlock(lock_t *lock) {
17     lock->flag = 0;
18 }
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.43

43

## SPIN LOCK EVALUATION

- **Correctness:**
  - Spin locks with atomic Test-and-Set:  
Critical sections won't be executed simultaneously by (2) threads
- **Fairness:**
  - No fairness guarantee. Once a thread has a lock, nothing forces it to relinquish it... lock distribution is random
- **Performance:**
  - Spin locks perform "busy waiting"
  - Spin locks are best for short periods of waiting ( $< 1$  time quantum)
  - Performance is slow when multiple threads share a CPU
    - Especially if "spinning" for long periods

45

## COMPARE AND SWAP

- Checks that the lock variable has the expected value **FIRST**, before changing its value
  - If so, make assignment
  - Return value at location
- Adds a comparison to TestAndSet method
  - Textbook presents C pseudo code
  - Assumption is that the compare-and-swap method runs atomically
- Useful for wait-free synchronization
  - Supports implementation of shared data structures which can be updated atomically (*as a unit*) using Hardware support: x86 CompareAndSwap instructions
  - Shared data structure updates become “wait-free”
  - Upcoming in Chapter 32

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.46

46

## COMPARE AND SWAP

- Compare and Swap

```
1  int CompareAndSwap(int *ptr, int expected, int new) {
2      int actual = *ptr;
3      if (actual == expected)
4          *ptr = new;
5      return actual;
}
```
- Spin Lock  
**C implementation on 1-core VM:  
Count is correct, no deadlock**

```
3      ; // spin
4  }
```
- x86 CPU provides “**cmpxchg1**” compare-and-exchange instructions
  - cmpxchg8b**
  - cmpxchg16b**

----------------	---	--------

47

### When implementing locks in a high-level language (e.g. C), what is missing that prevents implementation of CORRECT locks?

- Shared state variable
- Condition variables
- ATOMIC instructions
- Fairness
- None of the above

Start the presentation to see live content. For screen share software, share the entire screen. Get help at [pollev.com/app](https://pollev.com/app)

48

## “LOCK BUILDING” CPU INSTRUCTIONS ON ARM PROCESSORS

- Cooperative instructions used together to support synchronization on RISC systems
- No support on x86 processors
  - Supported by RISC: Alpha, PowerPC, ARM
- Load-linked (LL)
  - Loads value into register
  - Same as typical load
  - Used as a mechanism to track competition
- Store-conditional (SC)
  - Performs “mutually exclusive” store
  - Allows only one thread to store value

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.49

49

## LL/SC LOCK

```
1  int LoadLinked(int *ptr) {
2      return *ptr;
3  }
4
5  int StoreConditional(int *ptr, int value) {
6      if (no one has updated *ptr since the LoadLinked to this address) {
7          *ptr = value;
8          return 1; // success!
9      } else {
10         return 0; // failed to update
11     }
12 }
```

- LL instruction loads pointer value (ptr)
- SC only stores if the load link pointer has not changed
- Requires HW support
  - C code is psuedo code

April 27, 2023

School of Engineering and Technology, University of Washington - Tacoma

L10.53

53

## LOCK-BASED CONCURRENT DATA STRUCTURES

- Adding locks to data structures make them **thread safe**.
- Considerations:
  - Correctness
  - Performance
  - Lock granularity

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.54

54

## COUNTER STRUCTURE W/O LOCK

### ■ Synchronization weary --- not thread safe

```
1  typedef struct __counter_t {
2      int value;
3  } counter_t;
4
5  void init(counter_t *c) {
6      c->value = 0;
7  }
8
9  void increment(counter_t *c) {
10     c->value++;
11 }
12
13 void decrement(counter_t *c) {
14     c->value--;
15 }
16
17 int get(counter_t *c) {
18     return c->value;
19 }
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.55

55

## CONCURRENT COUNTER

```
1  typedef struct __counter_t {
2      int value;
3      pthread_lock_t lock;
4  } counter_t;
5
6  void init(counter_t *c) {
7      c->value = 0;
8      Pthread_mutex_init(&c->lock, NULL);
9  }
10
11 void increment(counter_t *c) {
12     Pthread_mutex_lock(&c->lock);
13     c->value++;
14     Pthread_mutex_unlock(&c->lock);
15 }
16
```

- Add lock to the counter
- Require lock to change data

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.56

56

CONCURRENT COUNTER - 2

- Decrease counter
- Get value

```
(Cont.)
17  void decrement(counter_t *c) {
18      pthread_mutex_lock(&c->lock);
19      c->value--;
20      pthread_mutex_unlock(&c->lock);
21  }
22
23  int get(counter_t *c) {
24      pthread_mutex_lock(&c->lock);
25      int rc = c->value;
26      pthread_mutex_unlock(&c->lock);
27      return rc;
28  }
```

School of Engineering and Technology, University of Washington - Tacoma

L10.57

57

CONCURRENT COUNTERS - PERFORMANCE

- Concurrent counter is considered a “precise counter”
- iMac: four core Intel 2.7 GHz i5 CPU
- Each thread increments counter 1,000,000 times

Threads	Precise (seconds)	Approximate (seconds)
1	0	0
2	~5.5	0
3	~9.5	0
4	~12.5	0

Precise counter scales poorly.

60

## APPROXIMATE (SLOPPY) COUNTER

- Provides single logical shared counter
  - Implemented using local counters for each ~CPU core
    - 4 CPU cores = 4 local counters & 1 global counter
    - Local counters are synchronized via local locks
  - Global counter is updated periodically
    - Global counter has lock to protect global counter value
    - Update threshold (S) – *referred to as sloppiness threshold*:  
How often to push local values to global counter
    - Small (S): more updates, more overhead
    - Large (S): fewer updates, more performant, less synchronized
- Why this implementation?  
Why do we want counters local to each CPU Core?

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.61

61

## APPROXIMATE COUNTER – MAIN POINTS

- Idea of the Approximate Counter is to **RELAX** the synchronization requirement for counting
  - Instead of synchronizing global count variable each time:  
**counter=counter+1**
  - Synchronization occurs only every so often:  
e.g. *every 1000 counts*
- Relaxing the synchronization requirement **drastically** reduces locking API overhead by trading-off split-second accuracy of the counter
- Approximate counter: trade-off accuracy for speed
  - It's approximate because it's not so accurate (until the end)

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.62

62

APPROXIMATE COUNTER - 2

- Update threshold ( $S$ ) = 5
- Synchronized across four CPU cores
- Threads update local CPU counters

Time	$L_1$	$L_2$	$L_3$	$L_4$	$G$
0	0	0	0	0	0
1	0	0	1	1	0
2	1	0	2	1	0
3	2	0	3	1	0
4	3	0	3	2	0
5	4	1	3	3	0
6	$5 \rightarrow 0$	1	3	4	5 (from $L_1$ )
7	0	2	4	$5 \rightarrow 0$	10 (from $L_4$ )

April 27, 2023

Text **WESLEYLLOYD641** to **22333** once to join

W

## Which of the following is NOT a problem as a result of having a low S-value for the approximate counter (Sloppy Counter) threshold?

The counter overhead is very high.

The counter implementation performs a very large number of LOCK/UNLOCK API calls.

The global counter value is highly accurate.

The counter performs very few local to global counter updates.

None of the above

## CONCURRENT LINKED LIST - 1

- Simplification - only basic list operations shown
- Structs and initialization:

```
1 // basic node structure
2 typedef struct __node_t {
3     int key;
4     struct __node_t *next;
5 } node_t;
6
7 // basic list structure (one used per list)
8 typedef struct __list_t {
9     node_t *head;
10    pthread_mutex_t lock;
11 } list_t;
12
13 void List_Init(list_t *L) {
14     L->head = NULL;
15     pthread_mutex_init(&L->lock, NULL);
16 }
17
18 (Cont.)
```

April 27, 2023

TCSS422: Operating Systems [Spring 2023]  
School of Engineering and Technology, University of Washington - Tacoma

L10.68

68

## CONCURRENT LINKED LIST - 2

- Insert – adds item to list
- Everything is critical!
  - There are two unlocks

```
(Cont.)
18  int List_Insert(list_t *L, int key) {
19      pthread_mutex_lock(&L->lock);
20      node_t *new = malloc(sizeof(node_t));
21      if (new == NULL) {
22          perror("malloc");
23          pthread_mutex_unlock(&L->lock);
24          return -1; // fail
25      }
26      new->key = key;
27      new->next = L->head;
28      L->head = new;
29      pthread_mutex_unlock(&L->lock);
30      return 0; // success
31  }
(Cont.)
```

School of Engineering and Technology, University of Washington - Tacoma

L10.69

69

## CONCURRENT LINKED LIST - 3

- Lookup – checks list for existence of item with key
- Once again everything is critical
  - Note - there are also two unlocks

```
(Cont.)
32
33  int List_Lookup(list_t *L, int key) {
34      pthread_mutex_lock(&L->lock);
35      node_t *curr = L->head;
36      while (curr) {
37          if (curr->key == key) {
38              pthread_mutex_unlock(&L->lock);
39              return 0; // success
40          }
41          curr = curr->next;
42      }
43      pthread_mutex_unlock(&L->lock);
44      return -1; // failure
45  }
```

L10.70

70

## CONCURRENT LINKED LIST

### ■ First Implementation:

- Lock **everything** inside Insert() and Lookup()
- If malloc() fails lock must be released
  - Research has shown “**exception-based control flow**” to be error prone
  - 40% of Linux OS bugs occur in rarely taken code paths
  - Unlocking in an exception handler is considered a poor coding practice
  - There is nothing specifically wrong with this example however

### ■ Second Implementation ...

School of Engineering and Technology, University of Washington - Tacoma

L10.73

73

## CONCURRENT LINKED LIST PERFORMANCE

- Using a single lock for entire list is not very performant
- Users must “wait” in line for a single lock to access/modify any item
- Hand-over-hand-locking (lock coupling)
  - Introduce a lock for each node of a list
  - Traversal involves handing over previous node’s lock, acquiring the next node’s lock...
  - Improves lock granularity
  - Degrades traversal performance
- Consider hybrid approach
  - Fewer locks, but more than 1
  - Best lock-to-node distribution?

- Assignment 1 - Due Tue May 9
- Quiz 1 (Due Thur Apr 27) – Quiz 2 (Due Tue May 2)
- Chapter 27: Linux Thread API
  - pthread\_cond\_wait/\_signal/\_broadcast
- Chapter 28: Locks
  - Introduction, Lock Granularity
  - Spin Locks, Test and Set, Compare and Swap
- Chapter 29: Lock Based Data Structures
  - Sloppy Counter
  - Concurrent Structures: Linked List, **Queue** Hash Table

## MICHAEL AND SCOTT CONCURRENT QUEUES

- Improvement beyond a single master lock for a queue (FIFO)
- Two locks:
  - One for the **head** of the queue
  - One for the **tail**
- Synchronize enqueue and dequeue operations
- Add a dummy node
  - Allocated in the queue initialization routine
  - Supports separation of head and tail operations
- Items can be added and removed by separate threads at the same time

## CONCURRENT QUEUE

### ■ Remove from queue

```
1  typedef struct __node_t {
2      int value;
3      struct __node_t *next;
4  } node_t;
5
6  typedef struct __queue_t {
7      node_t *head;
8      node_t *tail;
9      pthread_mutex_t headLock;
10     pthread_mutex_t tailLock;
11 } queue_t;
12
13 void Queue_Init(queue_t *q) {
14     node_t *tmp = malloc(sizeof(node_t));
15     tmp->next = NULL;
16     q->head = q->tail = tmp;
17     pthread_mutex_init(&q->headLock, NULL);
18     pthread_mutex_init(&q->tailLock, NULL);
19 }
20
(Cont.)
```

## CONCURRENT QUEUE - 2

### ■ Add to queue

```
(Cont.)
21 void Queue_Enqueue(queue_t *q, int value) {
22     node_t *tmp = malloc(sizeof(node_t));
23     assert(tmp != NULL);
24
25     tmp->value = value;
26     tmp->next = NULL;
27
28     pthread_mutex_lock(&q->tailLock);
29     q->tail->next = tmp;
30     q->tail = tmp;
31     pthread_mutex_unlock(&q->tailLock);
32 }
(Cont.)
```

## OBJECTIVES – 4/27

- Questions from 4/25
- C Tutorial - Pointers, Strings, Exec in C - Due Fri Apr 28
- Assignment 1 - Due Tue May 9
- Quiz 1 (Due Thur Apr 27) – Quiz 2 (Due Tue May 2)
- Chapter 27: Linux Thread API
  - pthread\_cond\_wait/\_signal/\_broadcast
- Chapter 28: Locks
  - Introduction, Lock Granularity
  - Spin Locks, Test and Set, Compare and Swap
- Chapter 29: Lock Based Data Structures
  - Sloppy Counter
  - Concurrent Structures: Linked List, Queue, **Hash Table**

## CONCURRENT HASH TABLE

- Consider a simple hash table
  - Fixed (static) size
  - Hash maps to a bucket
    - Bucket is implemented using a concurrent linked list
    - One lock per hash (bucket)
    - Hash bucket is a linked lists

80

## INSERT PERFORMANCE – CONCURRENT HASH TABLE

- Four threads – 10,000 to 50,000 inserts
  - iMac with four-core Intel 2.7 GHz CPU

Inserts (Thousands)	Simple Concurrent List (seconds)	Concurrent Hash Table (seconds)
10	~1.0	~0.5
20	~2.5	~0.5
30	~4.5	~0.5
40	~7.5	~0.5
50	~11.5	~0.5

The simple concurrent hash table scales magnificently.

81

## CONCURRENT HASH TABLE

```

1      #define BUCKETS (101)
2
3      typedef struct __hash_t {
4          list_t lists[BUCKETS];
5      } hash_t;
6
7      void Hash_Init(hash_t *H) {
8          int i;
9          for (i = 0; i < BUCKETS; i++) {
10             List_Init(&H->lists[i]);
11         }
12     }
13
14     int Hash_Insert(hash_t *H, int key) {
15         int bucket = key % BUCKETS;
16         return List_Insert(&H->lists[bucket], key);
17     }
18
19     int Hash_Lookup(hash_t *H, int key) {
20         int bucket = key % BUCKETS;
21         return List_Lookup(&H->lists[bucket], key);
22     }
```

----------------	---	--------

82

## Which is a major advantage of using concurrent data structures in your programs?

Locks are encapsulated within data structure code ensuring thread safety.

Lock granularity tradeoff already optimized inside data structurew

Multiple threads can more easily share data

All of the above

None of the above

## LOCK-FREE DATA STRUCTURES

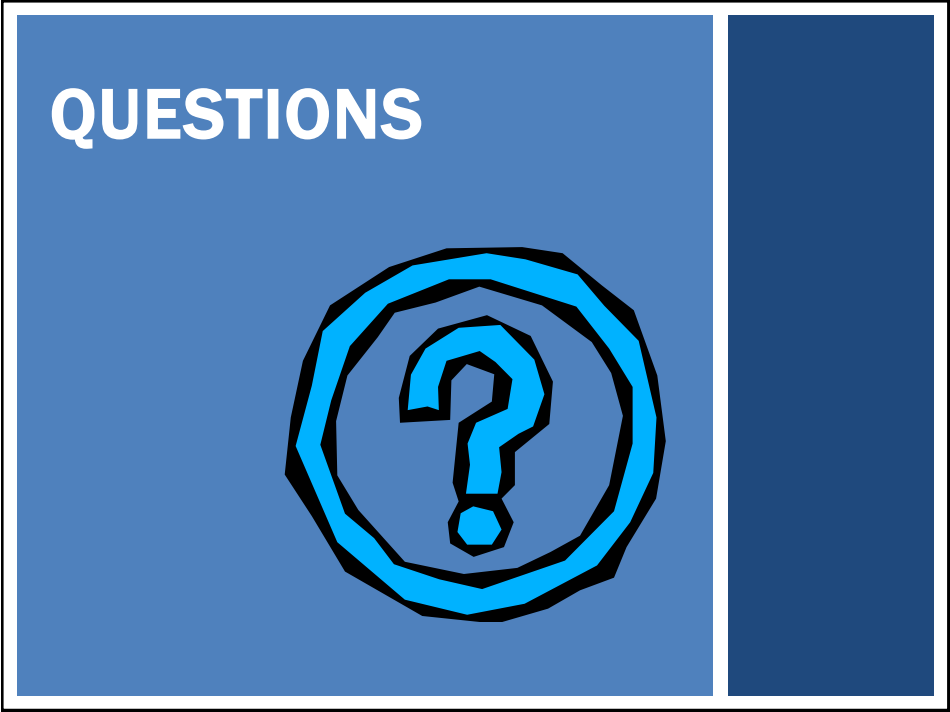

- Lock-free data structures in Java
- `Java.util.concurrent.atomic` package
- Classes:
  - `AtomicBoolean`
  - `AtomicInteger`
  - `AtomicIntegerArray`
  - `AtomicIntegerFieldUpdater`
  - `AtomicLong`
  - `AtomicLongArray`
  - `AtomicLongFieldUpdater`
  - `AtomicReference`
- See: <https://docs.oracle.com/en/java/javase/11/docs/api/java.base/java/util/concurrent/atomic/package-summary.html>
