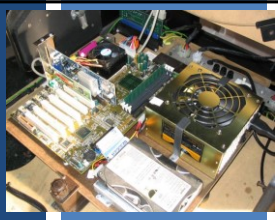
TCSS 422: OPERATING SYSTEMS



Beyond Physical Memory, I/O Devices, Hard Disk Drives

Wes J. Lloyd
School of Engineering and Technology
University of Washington - Tacoma

1

COURSE EVALUATION: TCSS 422 A SPRING 2023

- Please complete the course evaluation survey at:
- TCSS 422 A - Computer Operating Systems:
- https://uwt.iasystem.org/survey/112275
- **Special features this quarter in TCSS 422:**
- Class sessions LIVE streamed over Zoom, with all lecture recordings made available shortly after class
- No mandatory graded in class activities this quarter to maximize attendance/participation flexibility *(enables mostly asynchronous participation)*
- OBS Studio software used to provide different "scenes" that integrate screen captures with camera, chat, and displays
- Slide refinements to improve online delivery
- Assignment 3 graded as a Quiz/Tutorial: Kernel Module programming
- Extra credit for paperless daily feedback surveys
- Tutorial 3 on File Systems optional for extra credit
- Assignment 2–single producer, single consumer, multiple buffer provides revised scope having less C coding, with primary focus on pthreads, locking, and bounded buffer

2

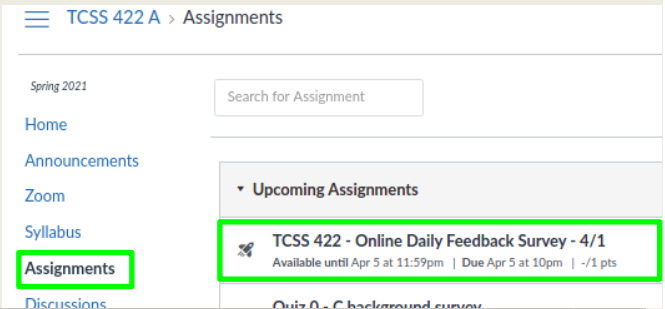
OBJECTIVES – 5/30

- **Questions from 5/25**
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

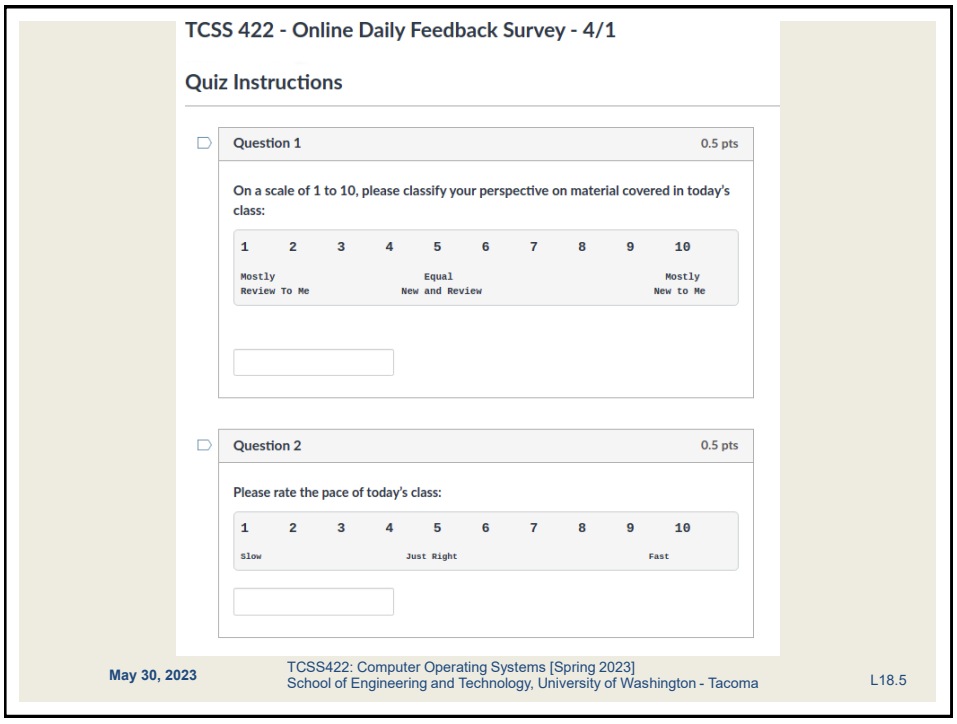
3

ONLINE DAILY FEEDBACK SURVEY

- Daily Feedback Quiz in Canvas – Available After Each Class
- Extra credit available for completing surveys ***ON TIME***
- Tuesday surveys: due by ~ Wed @ 11:59p
- Thursday surveys: due ~ Mon @ 11:59p

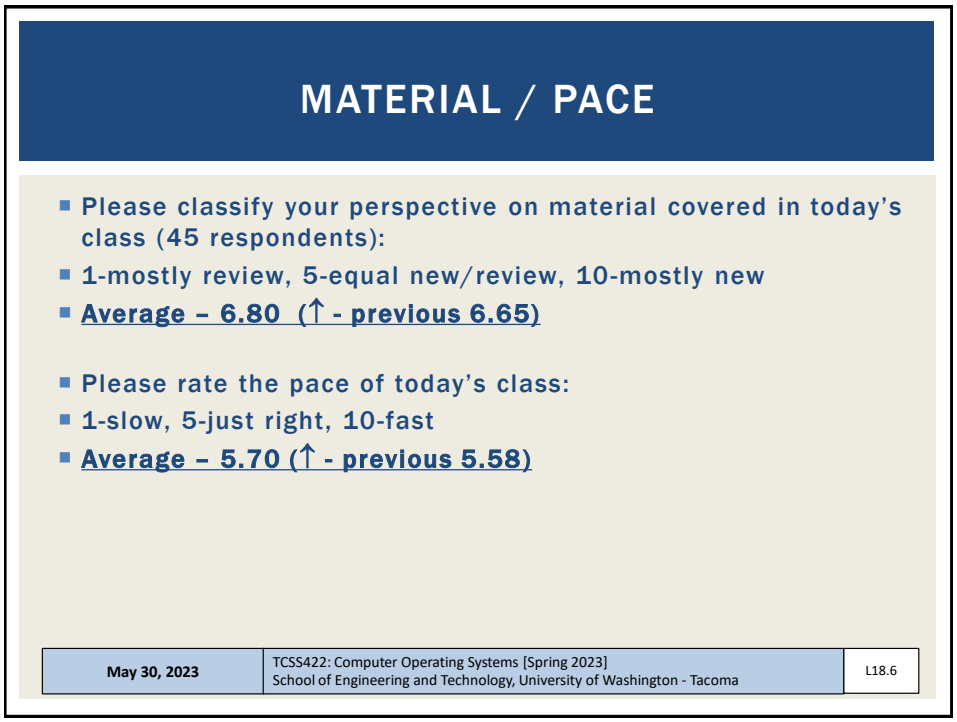


4



TCSS 422 - Online Daily Feedback Survey - 4/1
Quiz Instructions
Question 1
0.5 pts
On a scale of 1 to 10, please classify your perspective on material covered in today's class:
1 2 3 4 5 6 7 8 9 10
Mostly Review To Me
Equal New and Review
Mostly New to Me
Question 2
0.5 pts
Please rate the pace of today's class:
1 2 3 4 5 6 7 8 9 10
Slow
Just Right
Fast
May 30, 2023
TCSS422: Computer Operating Systems [Spring 2023]
School of Engineering and Technology, University of Washington - Tacoma
L18.5

5



MATERIAL / PACE
Please classify your perspective on material covered in today's class (45 respondents):
1-mostly review, 5-equal new/review, 10-mostly new
Average – 6.80 (↑ - previous 6.65)
Please rate the pace of today's class:
1-slow, 5-just right, 10-fast
Average – 5.70 (↑ - previous 5.58)
May 30, 2023
TCSS422: Computer Operating Systems [Spring 2023]
School of Engineering and Technology, University of Washington - Tacoma
L18.6

6

FEEDBACK FROM 5/25

- ***The address translation code seems the least clear to me.***
- 5-level Linux address translation not on the final exam
- Key concepts to know include:
  - Translating a virtual address to a physical address in Linux involves four or five levels of paging
  - The physical address is assembled by looking up segments of the address across different tables
  - Each additional table adds overhead to address translation increasing the importance of the TLB (page translation cache)
  - Additional levels of paging in x86_64 Linux are required compared to examples in textbook because Linux supports 48-bit virtual addresses
  - 64-bit Linux currently only supports 48-bit addresses
    - 32-bit Linux supported up to a 4GB address space
    - 64-bit Linux with 48-bit addressing supports up to 256 TB of memory

7

OBJECTIVES – 5/30

- Questions from 5/25
- **Assignment 2 – June 2**
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

8

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- **Assignment 3: (Tutorial) Introduction to Linux Kernel Modules**
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

9

ASSIGNMENT 3: INTRODUCTION TO LINUX KERNEL MODULES

- Assignment 3 provides an introduction to kernel programming by demonstrating how to create a Linux Kernel Module
- Kernel modules are commonly used to write device drivers and can access protected operating system data structures
  - For example: Linux `task_struct` process data structure
- Assignment 3 is scored in the Quizzes / Activities / Tutorials category
  - Lowest two grades in this category are dropped

10

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- **Memory Segmentation Activity + answers (available in Canvas)**
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

11

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- **Quiz 4 – Page Tables - Due June 8 @ 11:59am**
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

12

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- **Final exam – June 8 @ 3:40pm**
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

13

FINAL EXAM – THURSDAY JUNE 8 @ 3:40PMTH

- Thursday June 8 from 3:40 to 5:40 pm
  - Final (100 points)
  - SHORT: similar number of questions as the midterm
  - 2-hours
  - Focus on new content - since the midterm (~70% new, 30% before)
- Final Exam Review -
  - Complete Memory Segmentation Activity
  - Complete Quiz 4
  - Practice Final Exam Questions – 2nd hour of June 1st class session
  - Individual work
  - 2 pages of notes (any sized paper), double sided
  - Basic calculators allowed
  - NO smartphones, laptop, book, Internet, group work

14

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- **Tutorial 3 - File Systems (Optional, Extra Credit)**
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

15

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- **Chapter 21/22: Beyond Physical Memory**
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

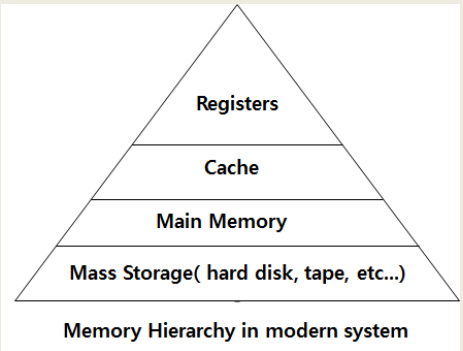
16

CHAPTER 21/22: BEYOND PHYSICAL MEMORY

17

MEMORY HIERARCHY

- Disks (HDD, SSD) provide another level of storage in the memory hierarchy



Memory Hierarchy in modern system

18

MOTIVATION FOR EXPANDING THE ADDRESS SPACE

- Provide the illusion of an address space larger than physical RAM
- For a single process
  - Convenience
  - Ease of use
- For multiple processes
  - Large virtual memory space supports running *many concurrent processes. . .*

19

LATENCY TIMES

- Design considerations:
  - SSDs 4x the time of DRAM
  - HDDs 80x the time of DRAM

Action	Latency (ns)	(µs)	
L1 cache reference	0.5ns		
L2 cache reference	7 ns		14x L1 cache
Mutex lock/unlock	25 ns		
Main memory reference	100 ns		20x L2 cache, 200x L1
Read 4K randomly from SSD*	150,000 ns	150 µs	~1GB/sec SSD
Read 1 MB sequentially from memory	250,000 ns	250 µs	
Read 1 MB sequentially from SSD*	1,000,000 ns	1,000 µs	1 ms ~1GB/sec SSD, 4X memory
Read 1 MB sequentially from disk	20,000,000 ns	20,000 µs	20 ms 80x memory, 20X SSD

- *Latency numbers every programmer should know*
- From: https://gist.github.com/jboner/2841832#file-latency-txt

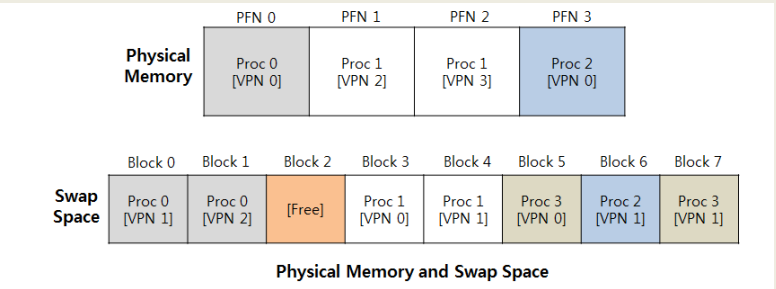
20

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - **Swapping Mechanisms** Swapping Policies
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

SWAP SPACE

- Disk space for storing memory pages
- "Swap" them in and out of memory to disk as needed



Physical Memory and Swap Space

SWAP SPACE - 2

- The size of the swap space can be seen using the Linux free command: "free –h"

```
wlloyd@dione:~$ free -h
              total        used        free      shared  buff/cache   available
Mem:            30G         11G         14G        1.3G        4.4G         17G
Swap:           31G          0B         31G
```

- With sufficient disk space, a common allocation is to create Swap space greater than or equal to physical RAM

SWAP SPACE - 3

- Swap space lives on a separate logical volume in Ubuntu Linux that is managed separately from the root file system
- Check logical volumes with "sudo lvdisplay" command:

```
--- Logical volume ---
LV Path                /dev/ubuntu-vg/swap_1
LV Name                swap_1
VG Name                ubuntu-vg
LV UUID                G1Ovj6-4M33-2YXY-YETH-Wf7V-93vF-QRQytG
LV Write Access        read/write
LV Creation host, time ubuntu, 2018-09-30 15:44:16 -0700
LV Status              available
# open                 2
LV Size                976.00 MiB
Current LE             244
Segments               1
Allocation             inherit
Read ahead sectors     auto
- currently set to     256
Block device           253:1
```

- See also "lvm lvs" command

PAGE LOCATION

- Memory pages are:
  - Stored in memory
  - Swapped to disk
- Present bit
  - In the page table entry (PTE) indicates if page is present
- Page fault
  - Memory page is accessed, but has been swapped to disk

25

PAGE FAULT

- OS steps in to handle the page fault
- Loading page from disk requires a free memory page
- Page-Fault Algorithm

```
1:      PFN = FindFreePhysicalPage()
2:      if (PFN == -1)                  // no free page found
3:              PFN = EvictPage()       // run replacement algorithm
4:      DiskRead(PTE.DiskAddr, pfn)     // sleep (waiting for I/O)
5:      PTE.present = True              // set PTE bit to present
6:      PTE.PFN = PFN                   // reference new loaded page
7:      RetryInstruction()              // retry instruction
```

26

PAGE REPLACEMENTS

- Page daemon
  - Background threads which monitors swapped pages
- Low watermark (LW)
  - Threshold for when to swap pages to disk
  - Daemon checks: free pages < LW
  - Begin swapping to disk until reaching the highwater mark
- High watermark (HW)
  - Target threshold of free memory pages
  - Daemon free until: free pages >= HW

27

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, **Swapping Policies**
- Ch. 36 I/O Devices, Ch. 37 Hard Disk Drives

28

REPLACEMENT POLICIES

29

CACHE MANAGEMENT

- Replacement policies apply to "any" cache
- Goal is to minimize the number of misses
- Average memory access time (AMAT) can be estimated:

$$AMAT = (P_{Hit} * T_M) + (P_{Miss} * T_D)$$

Argument	Meaning
T_M	The cost of accessing memory (time)
T_D	The cost of accessing disk (time)
P_{Hit}	The probability of finding the data item in the cache(a hit)
P_{Miss}	The probability of not finding the data in the cache(a miss)

- Consider T_M = 100 ns, T_D = 10ms
- Consider P_{hit} = .9 (90%), P_{miss} = .1
- Consider P_{hit} = .999 (99.9%), P_{miss} = .001

30

$P_H = .9$ $P_m = .1$

$T_D = 10\ ms$ $T_m = 100\ ns$

$T_m = .0001\ ms$

$AMAT = .9 \times .0001 + .1 \times 10$

$.00009 + 1$

$1.00009\ ms$

$P_H = .999$ $P_m = .001$

$AMAT = .999(.0001) + (.001)(10)$

$AMAT = .010099\ ms$

31

OPTIMAL REPLACEMENT POLICY

- What if:
  - We could predict the future (… with a magical oracle)
  - All future page accesses are known
  - Always replace the page in the cache used farthest in the future
- Used for a comparison
- Provides a "best case" replacement policy

cache size = 3

- Consider a 3-element empty cache with the following page accesses:

m m m H H m H H H m H

0 1 2 0 1 3 0 3 1 2 1

5 m

6 H

What is the hit/miss ratio?

6 hits 6/5

32

FIFO REPLACEMENT

- Queue based
- **Always replace the oldest element** at the back of cache
- Simple to implement
- Doesn't consider importance… just arrival ordering
- Consider a 3-element empty cache with the following page accesses:

m m m H H m m H m m H

0 1 2 0 1 3 0 3 1 2 1

Cache
0
1 0
2 1 0
1 0 3
2 1 0
0 3 2

- What is the hit/miss ratio?

4 hits

- How is FIFO different than LRU?

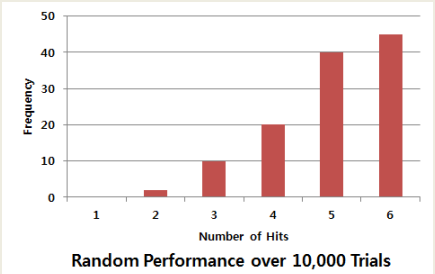
LRU incorporates history

33

RANDOM REPLACEMENT

- Pick a page at random to replace
- Simple and fast implementation
- Performance depends on luck of random choices

0 1 2 0 1 3 0 3 1 2 1



Random Performance over 10,000 Trials

34

HISTORY-BASED POLICIES

- LRU: Least recently used
- Always replace page with oldest access time (front)
- Always move end of cache when element is read again
- LRU requires constant reorganization of the cache
- Considers temporal locality (*when pg was last accessed*)

M M M H H M H H H M H
0 1 2 0 1 3 0 3 1 2 1

What is the hit/miss ratio?

6 hits

- LFU: Least frequently used
- Always replace page with the fewest # of accesses (front)
- Incorporates frequency of use - *must track pg accesses*
- Consider frequency of page accesses

0 1 2 0 1 3 0 3 1 2 1

35

LFU

- LFU: Least frequently used
- Always replace page with the fewest # of accesses (front)
- Incorporates frequency of use - *must track pg accesses*
- Consider frequency of page accesses

0 1 2 0 1 3 0 3 1 2 1

What is the hit/miss ratio?

Hit/miss ratio is=6 hits

36

WE WILL RETURN AT 5:04PM

May 30, 2023 TCSS422: Operating Systems [Spring 2023] School of Engineering and Technology, University of Washington - coma L18.37

37

Consider a 3-element cache. With a FIFO replacement policy, how many hits occur with the following page access sequence:

1 2 0 1 3 1 2 0 2 1 3

- 2 hits
- 3 hits
- 4 hits
- 5 hits
- 6 hits

May 30, 2023 TCSS422: Operating Systems [Spring 2023] School of Engineering and Technology, University of Washington - Tacoma L18.38

Start the presentation to see live content. For screen share software, share the entire screen. Get help at pollev.com/app

38

Consider a 3-element cache. With an LRU replacement policy, how many hits occur with the following page access sequence:

1 2 0 1 3 1 2 0 2 1 3

2 hits

3 hits

4 hits

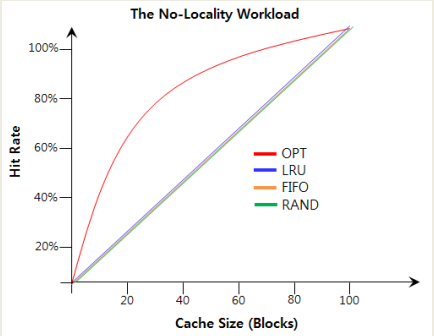
5 hits

6 hits

39

WORKLOAD EXAMPLES: NO-LOCALITY

- No-Locality (Random Access) Workload
  - Perform 10,000 random page accesses
  - Across set of 100 memory pages

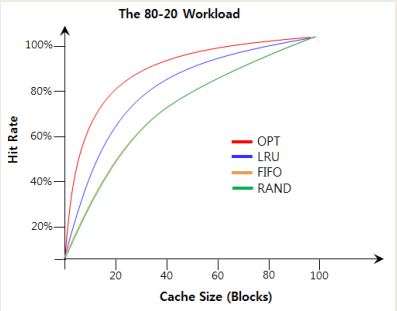


When the cache is large enough to fit the entire workload, it doesn't matter which policy you use.

40

WORKLOAD EXAMPLES: 80/20

- 80/20 Workload
  - Perform 10,000 page accesses, against set of 100 pages
  - 80% of accesses are to 20% of pages (hot pages)
  - 20% of accesses are to 80% of pages (cold pages)



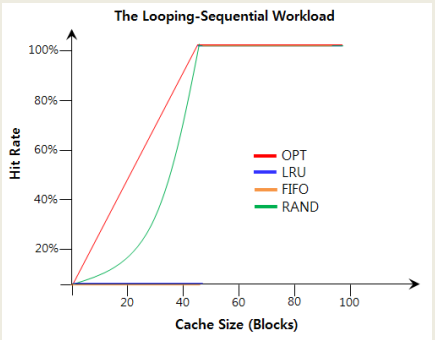
LRU is more likely to hold onto hot pages

(recalls history)

41

WORKLOAD EXAMPLES: SEQUENTIAL

- Looping sequential workload
  - Refer to 50 pages in sequence: 0, 1, …, 49
  - Repeat loop



Random performs better than FIFO and LRU for cache sizes < 50

Algorithms should provide "scan resistance"

42

With small cache sizes, for the looping sequential workload, why do FIFO and LRU fail to provide cache hits?

Cache hits in this scenario require consideration of how frequently accessed memory is for cache replacement

Memory accesses are unpredictable and too random. Unpredictable accesses require a random cache replacement policy for cache hits

Memory accesses to elements that are accessed repeatedly are too spread apart temporally to benefit from caching

Unlike Random cache replacement, both FIFO and LRU fail to speculate memory accesses in advance to improve caching

None of the above

Start the presentation to see live content. For screen share software, share the entire screen. Get help at **pollev.com/app**

43

IMPLEMENTING LRU

- Implementing last recently used (LRU) requires tracking access time for all system memory pages
- Times can be tracked with a list
- For cache eviction, we must scan an entire list
- Consider: 4GB memory system (2^{32}), with 4KB pages (2^{12})
- This requires 2^{20} comparisons !!!
- Simplification is needed
  - Consider how to approximate the oldest page access

44

IMPLEMENTING LRU - 2

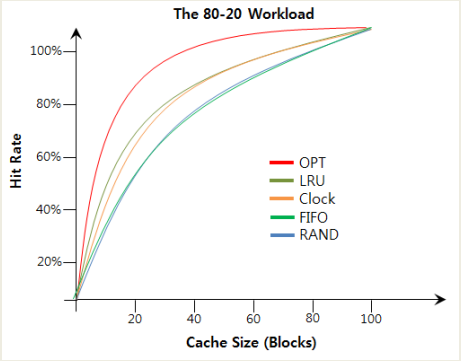
- Harness the Page Table Entry (PTE) Use Bit
- HW sets to 1 when page is used
- OS sets to 0

- Clock algorithm (*approximate LRU*)
  - Refer to pages in a circular list
  - Clock hand points to current page
  - Loops around
    - IF USE_BIT=1 set to USE_BIT = 0
    - IF USE_BIT=0 replace page

45

CLOCK ALGORITHM

- Not as efficient as LRU, but better than other replacement algorithms that do not consider history



46

CLOCK ALGORITHM - 2

- Consider dirty pages in cache
- If DIRTY (modified) bit is FALSE
  - No cost to evict page from cache
- If DIRTY (modified) bit is TRUE
  - Cache eviction requires updating memory
  - Contents have changed
- Clock algorithm should favor no cost eviction

47

WHEN TO LOAD PAGES

- On demand → demand paging
- Prefetching
  - Preload pages based on anticipated demand
  - Prediction based on locality
  - Access page P, suggest page P+1 may be used
- What other techniques might help anticipate required memory pages?
  - Prediction models, historical analysis
  - In general: accuracy vs. effort tradeoff
  - High analysis techniques struggle to respond in real time

48

OTHER SWAPPING POLICIES

- Page swaps / writes
  - Group/cluster pages together
  - Collect pending writes, perform as batch
  - Grouping disk writes helps amortize latency costs
- Thrashing
  - Occurs when system runs many memory intensive processes and is low in memory
  - Everything is constantly swapped to-and-from disk

49

OTHER SWAPPING POLICIES - 2

- Working sets (of processes)
  - Groups of related processes
  - When thrashing: prevent one or more working set(s) from running
  - Temporarily reduces memory burden
  - Allows some processes to run, reduces thrashing

50

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- **Ch. 36 I/O Devices**, Ch. 37 Hard Disk Drives

51

CHAPTER 36: I/O DEVICES

52

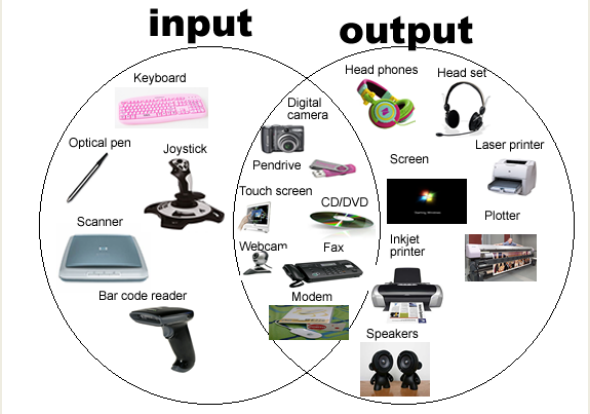
OBJECTIVES

- Chapter 36
  - I/O: Polling vs Interrupts
  - Programmed I/O (PIO)
    - Port-mapped I/O (PMIO)
    - Memory-mapped I/O (MMIO)
  - Direct memory Access (DMA)

53

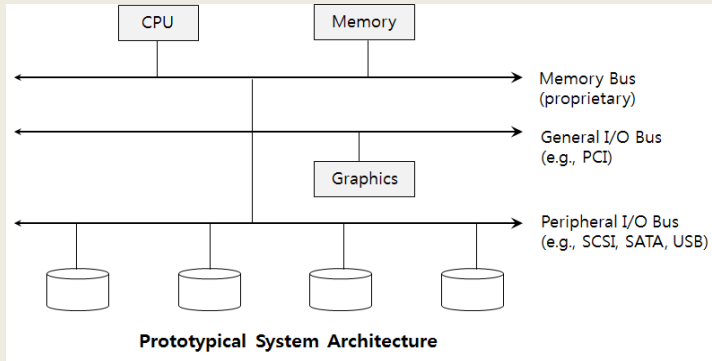
I/O DEVICES

- Modern computer systems interact with a variety of devices



54

COMPUTER SYSTEM ARCHITECTURE



Prototypical System Architecture

VERY FAST: CPU is attached to main memory via a Memory bus.
FAST: High speed devices (e.g. video) are connected via a General I/O bus.
SLOWER: Disks are connected via a Peripheral I/O bus.

55

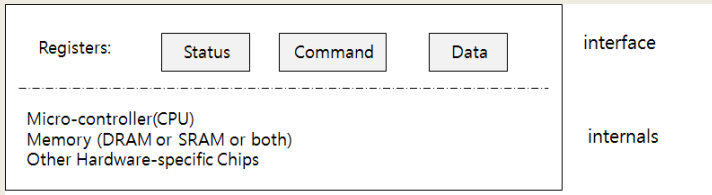
I/O BUSES

- Buses
  - Buses closer to the CPU are faster
  - Can support fewer devices
  - Further buses are slower, but support more devices
- Physics and costs dictate "levels"
  - Memory bus
  - General I/O bus
  - Peripheral I/O bus
- Tradeoff space: speed vs. locality

56

CANONICAL DEVICE

- Consider an arbitrary canonical *"standard/generic"* device



Canonical Device

- Two primary components
  - Interface (registers for communication)
  - Internals: Local CPU, memory, specific chips, firmware (embedded software)

CANONICAL DEVICE: HARDWARE INTERFACE

- Status register
  - Maintains current device status
- Command register
  - Where commands for interaction are sent
- Data register
  - Used to send and receive data to the device

General concept:
The OS interacts and controls device behavior by reading and writing the device registers.

OS DEVICE INTERACTION

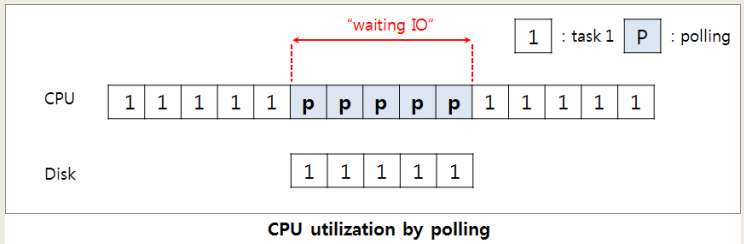
- Common example of device interaction

```
while ( STATUS == BUSY)        <- Poll- Is device available?
    ; //wait until device is not busy
write data to data register    <- Command parameterization
write command to command register  <- Send command
    Doing so starts the device and executes the command
while ( STATUS == BUSY)        <- Poll – Is device done?
    ; //wait until device is done with your request
```

59

POLLING

- OS checks if device is *READY* by repeatedly checking the STATUS register
  - Simple approach
  - CPU cycles are wasted without doing meaningful work
  - Ok if only a few cycles, for rapid devices that are often READY
  - BUT polling, as with "spin locks" we understand is inefficient



CPU utilization by polling

60

INTERRUPTS VS POLLING

- For longer waits, put process waiting on I/O to sleep
- Context switch (C/S) to another process
- When I/O completes, fire an interrupt to initiate C/S back
  - Advantage: better multi-tasking and CPU utilization
  - Avoids: unproductive CPU cycles (polling)

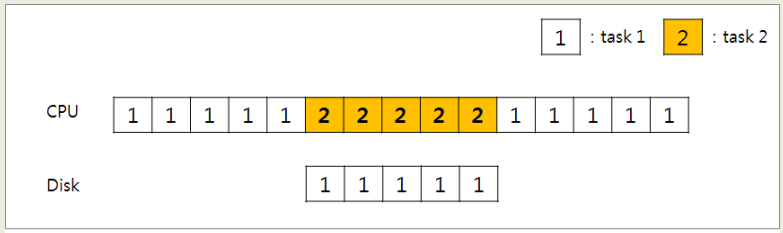


Diagram of CPU utilization by interrupt

61

INTERRUPTS VS POLLING - 2

What is the tradeoff space ?

- Interrupts are not always the best solution
  - How long does the device I/O require?
  - What is the cost of context switching?

If device I/O is fast → polling is better.
When I/O time < 1 CPU time slice (e.g. 10 ms)

If device I/O is slow → interrupts are better.
When I/O time > 1 CPU time slice

62

INTERRUPTS VS POLLING - 3

- Alternative: two-phase hybrid approach
  - Initially poll, then sleep and use interrupts
- Issue: livelock problem
  - Common with network I/O
  - Many arriving packets generate ***many many*** interrupts
  - Overloads the CPU!
  - No time to execute code, just interrupt handlers !
- Livelock optimization
  - Coalesce multiple arriving packets (for different processes) into fewer interrupts
  - Must consider number of interrupts a device could generate

63

DEVICE I/O

- To interact with a device we must send/receive DATA
- There are two general approaches:
  - Programmed I/O (PIO):
    - Port mapped I/O (PMIO)
    - Memory mapped I/O (MMIO)
  - Direct memory access (DMA)

64

Transfer Modes

Mode	#	Maximum transfer rate (MB/s)	cycle time
PIO	0	3.3	600 ns
	1	5.2	383 ns
	2	8.3	240 ns
	3	11.1	180 ns
	4	16.7	120 ns
Single-word DMA	0	2.1	960 ns
	1	4.2	480 ns
	2	8.3	240 ns
Multi-word DMA	0	4.2	480 ns
	1	13.3	150 ns
	2	16.7	120 ns
	3[34]	20	100 ns
	4[34]	25	80 ns
Ultra DMA	0	16.7	240 ns ÷ 2
	1	25.0	160 ns ÷ 2
	2 (Ultra ATA/33)	33.3	120 ns ÷ 2
	3	44.4	90 ns ÷ 2
	4 (Ultra ATA/66)	66.7	60 ns ÷ 2
	5 (Ultra ATA/100)	100	40 ns ÷ 2
	6 (Ultra ATA/133)	133	30 ns ÷ 2
	7 (Ultra ATA/167)[35]	167	24 ns ÷ 2

65

PROGRAMMED I/O (PIO)

- I/O performed on the CPU
- CPU time is consumed performing I/O
- CPU supports data movement (input/output)
- PIO is slow: CPU is occupied with meaningless work

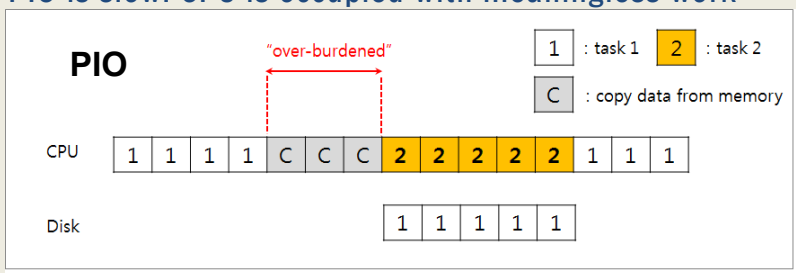

Diagram of CPU utilization

66

PIO DEVICES

- Legacy serial ports
- Legacy parallel ports
- PS/2 keyboard and mouse
- Legacy MIDI, joysticks
- Old network interfaces

67

PROGRAMMED I/O DEVICE (PIO) INTERACTION

- Two primary PIO methods
  - Port mapped I/O (PMIO)
  - Memory mapped I/O (MMIO)

68

PORT MAPPED I/O (PMIO)

- Device specific CPU I/O Instructions
- Follows a CISC model:
  specific CPU instructions used for device I/O
- x86-x86-64: `in` and `out` instructions
- `outb`, `outw`, `outl`
- 1, 2, 4 byte copy from EAX → device's I/O port

69

MEMORY MAPPED I/O (MMIO)

- Device's memory is mapped to standard memory addresses
- MMIO is common with RISC CPUs:
  Special CPU instructions for PIO eliminated
- Old days: 16-bit CPUs didn't have a lot of spare memory space
- Today's CPUs have LARGE address spaces:
  32-bit (4GB addr space) & 64-bit (128 TB addr space)
- Device I/O uses regular CPU instructions usually used to read/write memory to access device
- Device is mapped to unique memory address **reserved** for I/O
  - Address must not be available for normal memory operations.
  - Generally very high addresses (out of range of type addresses)
- Device monitors CPU address bus and respond to instructions on their addresses

70

DIRECT MEMORY ACCESS (DMA)

- Copy data in memory by ***offloading*** to "DMA controller"
- Many devices (including CPUs) integrate DMA controllers
- CPU gives DMA: memory address, size, and copy instruction
- DMA performs I/O independent of the CPU
- DMA controller generates CPU interrupt when I/O completes

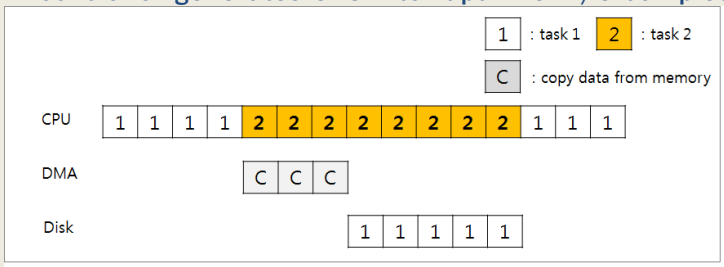

Diagram of CPU utilization by DMA

71

DIRECTORY MEMORY ACCESS – 2

- Many devices use DMA
  - HDD/SSD controllers (ISA/PCI)
  - Graphics cards
  - Network cards
  - Sound cards
  - Intra-chip memory transfer for multi-core processors
- DMA allows computation and data transfer time to proceed in parallel

72

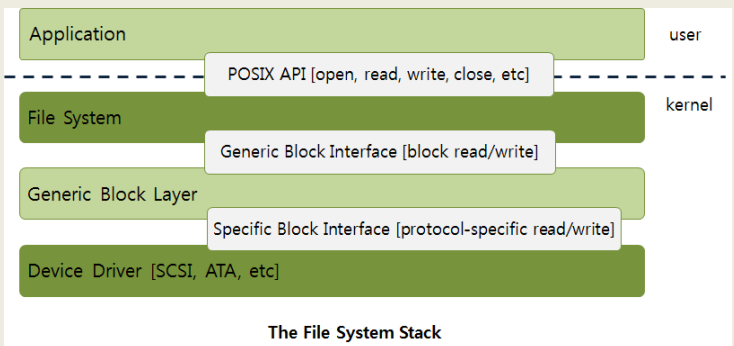
DEVICE INTERACTION

- The OS must interact with a variety of devices
- Example: Consider a file system that works across a variety of types of disks:
  - SCSI, IDE, USB flash drive, DVD, etc.
- File system should be general purpose, where device specific I/O implementation details are abstracted
- **Device drivers** use abstraction to provide general interfaces for vendor specific hardware
- In Linux: block devices

73

FILE SYSTEM ABSTRACTION

- Layers of I/O abstraction in Linux
- C functions (open, read, write) issue **block read** and **write** requests to the generic block layer



The File System Stack

74

FILE SYSTEM ABSTRACTION ISSUES

- **Too much abstraction**
- Many devices provide special capabilities
- Example: SCSI Error handling
- SCSI devices provide extra details which are lost to the OS
- **Buggy device drivers**
- 70% of OS code is in device drivers
- Device drivers are required for every device plugged in
- Drivers are often 3rd party, which is not quality controlled at the same level as the OS (Linux, Windows, MacOS, etc.)

75

OBJECTIVES – 5/30

- Questions from 5/25
- Assignment 2 – June 2
- Assignment 3: (Tutorial) Introduction to Linux Kernel Modules
- Memory Segmentation Activity + answers (available in Canvas)
- Quiz 4 – Page Tables - Due June 8 @ 11:59am
- Final exam – June 8 @ 3:40pm
- Tutorial 3 - File Systems (Optional, Extra Credit)
- Chapter 21/22: Beyond Physical Memory
  - Swapping Mechanisms, Swapping Policies
- Ch. 36 I/O Devices, **Ch. 37 Hard Disk Drives**

76

CH. 37: HARD DISK DRIVES

77

OBJECTIVES

- Chapter 37
  - HDD Internals
  - Seek time
  - Rotational latency
  - Transfer speed
  - Capacity
  - Scheduling algorithms

78

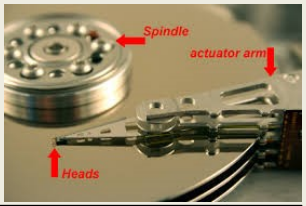
HARD DISK DRIVE (HDD)

- Primary means of data storage (persistence) for decades
  - Remains inexpensive for high capacity storage
  - 2020: 16 TB HDD - $400, ~15.3 TB SSD - $4,380
- Consists of a large number of data **sectors**
- Sector size is 512-bytes
- An n sector HDD
  can be is addressed as an array of 0..n-1 sectors

79

HDD INTERFACE

- Writing disk sectors is atomic (512 bytes)
- Sector writes are completely successful, or fail
- Many file systems will read/write 4KB at a time
  - Linux ext3/4 default filesystem blocksize – 4096
- Same as typical memory page size



80

BLOCK SIZE IN LINUX EXT4

- `mkefs.ext4 -i <bytes-per-inode>`
- Formats disk w/ ext4 filesys with specified byte-to-inode ratio
- Today's disks are so large, some use cases with many small files can run out of inodes before running out of disk space
- Each inode record tracks a file on the disk
- Larger bytes-per-inode ratio results in fewer inodes
  - Default is around ~4096
- Value shouldn't be smaller than blocksize of filesystem
- **Note:** It is not possible to expand the number of inodes after the filesystem is created, - be careful deciding the value
- Check inode stats: `tune2fs -l /dev/sda1` *(← disk dev name)*

81

EXAMPLE: USDA SOIL EROSION MODEL WEB SERVICE (RUSLE2)

- Host ~2,000,000 small XML files totaling 9.5 GB on a ~20GB filesystem on a cloud-based Virtual Machine
- With default inode ratio (4096 block size), only ~488,000 files will fit
- Drive less than half full, but files will not fit !
- HDDs support a minimum block size of 512 bytes
- OS filesystems such as ext3/ext4 can support "finer grained" management at the expense of a larger catalog size
  - Small inode ratio- inodes will considerable % of disk space

82

EXAMPLE: USDA SOIL EROSION MODEL WEB SERVICE (RUSLE2) - 2

- Free space in bytes (df)

```
Device              total size   bytes-used  bytes-free usage
/dev/vda2           13315844     9556412     3049188    76% /mnt
```

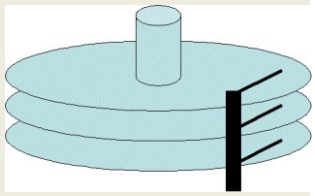
- Free inodes (df –i) @ 512 bytes / node

```
Device            total inodes   used      free      usage
/dev/vda2          3552528 1999823 1552705   57%    /mnt
```

83

HDD INTERFACE - 2

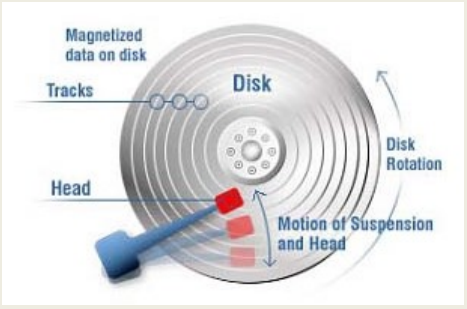
- Torn write
  - When OS uses larger block size than HDD
  - Block writes not **atomic** - they SPAN multiple HDD sectors
  - Upon power failure only a portion of the OS block is written – *can lead to data corruption…*
- HDD access
  - Sequential reads of sectors is fastest
  - Random sector reads are slow
  - Disk head continuously must jump to different tracks



84

HDD PLATTER

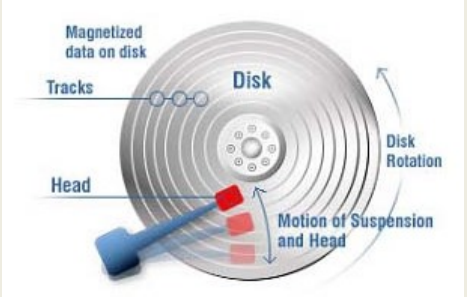
- Made from aluminum coated with thin magnetic layer
- HDD records on both sides of each platter
- Data is stored by inducing magnetic changes



85

HDD SPINDLE

- Connected to motor which spins the disk
- Speed measures in RPM (rotations per minute)
- Typical: 7200-15000 rpm
- 10000 rpm – 1 rotation in 6ms; 15k rpm 1 rotation in 4ms

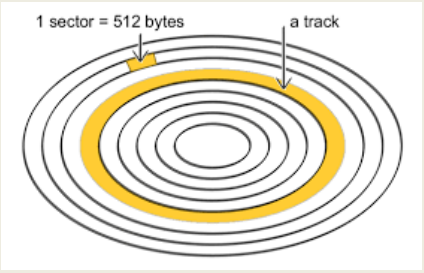


86

HDD TRACK

- Concentric circle of sectors
- Single side of platter contains 290 K tracks (2008)
- Zones: groups of tracks with same # of sectors

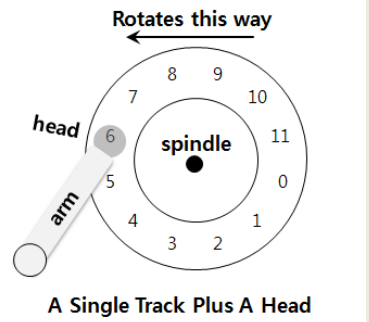
Outer tracks have More sectors



87

EXAMPLE: SIMPLE DISK DRIVE

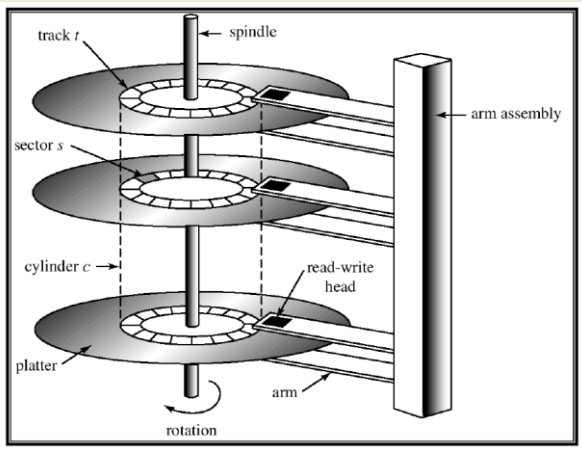
- Single track disk
- Head: one per surface of drive
- Arm: moves heads across surface of platters



A Single Track Plus A Head

88

HARD DISK STRUCTURE

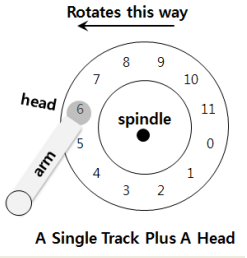


89

SINGLE-TRACK LATENCY: THE ROTATIONAL DELAY

- **Rotational latency** ($T_{rotation}$): time to rotate to desired sector
- Average $T_{rotation}$ is ~ about half the time of a full rotation
- How to calculate $T_{rotation}$ from rpm
1. Calculate time for 1 rotation based on rpm
   > Convert rpm to rps
2. Divide by two (*average rotational latency*)

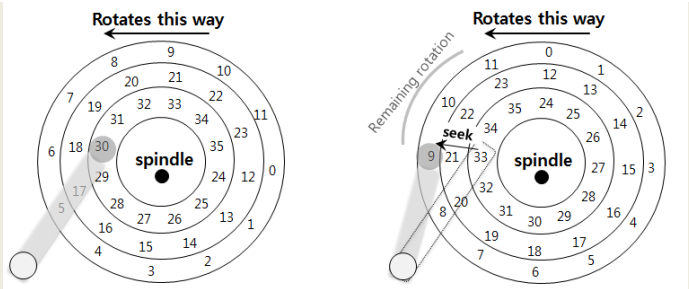
- 7200rpm = 8.33ms per rotation /2= ~4.166ms
- 10000rpm = 6ms per rotation /2= ~3ms
- 15000rpm = 4ms per rotation /2= ~2ms



A Single Track Plus A Head

90

SEEK TIME



Three Tracks Plus A Head (Right: With Seek)
(e.g., read to sector 11)

- **Seek time** (T_{seek}): time to move disk arm to proper track
- Most time consuming HDD operation

91

FOUR PHASES OF SEEK

- Acceleration → coasting → deceleration →settling
- **Acceleration**: the arm gets moving
- **Coasting**: arm moving at full speed
- **Deceleration**: arm slow down
- **Settling**: Head is carefully positioned over track
  - Settling time is often high, from .5 to 2ms

92

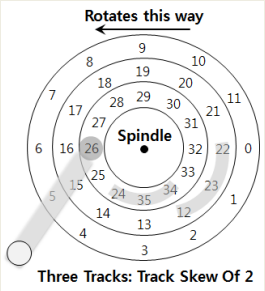
HDD I/O

- Data transfer
  - Final phase of I/O: time to read or write to disk surface
- Complete I/O cycle:
  1. Seek (accelerate, coast, decelerate, settle)
  2. Wait on rotational latency (*until track aligns*)
  3. Data transfer

93

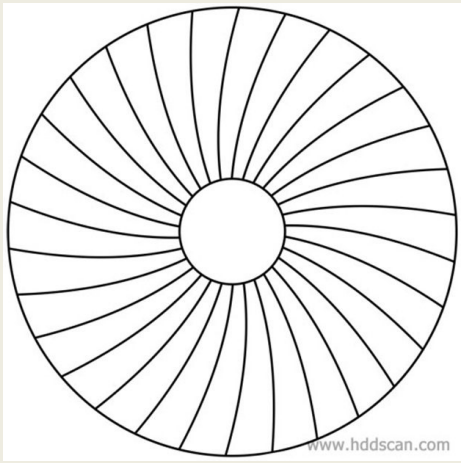
TRACK SKEW

- Sectors are offset across tracks to allow time for head to reposition for sequential reads
- Without track skew, when head is repositioned sector would have already been passed



94

TRACK SKEW - 2



95

HDD CACHE

- Buffer to support caching reads and writes
- Improves drive response time
- Up to 256 MB, slowly have been growing
- Two styles
  - Writeback cache
    - Report write complete immediately when data is transferred to HDD cache
    - Dangerous if power is lost
  - Writethrough cache
    - Reports write complete only when write is physically completed on disk

96

TRANSFER SPEED

- Can calculate I/O transfer speed with:
- I/O Time: $T_{I/O} = T_{seek} + T_{rotation} + T_{transfer}$
- $T_{transfer}$ = $DATA_{size}$ x $Rate_{I/O}$
- Rate of I/O: $R_{I/O} = \frac{Size_{Transfer}}{T_{I/O}}$

97

EXAMPLE: I/O SPEED

- Compare two disks:

1. Random workload: 4KB (random read on HDD)
2. Sequential workload: 100MB (contiguous sectors)
   > Calculate $T_{rotation}$ from rpm (rpm→rps, time for 1 rotation / 2)

	Cheetah 15K.5	Barracuda
Capacity	300 GB	1 TB
RPM	15,000	7,200
Average Seek	4 ms	9 ms
Max Transfer	125 MB/s	105 MB/s
Platters	4	4
Cache	16 MB	16/32 MB
Connects Via	SCSI	SATA

Disk Drive Specs: SCSI Versus SATA

98

EXAMPLE: I/O SPEED

1. Random workload: 4KB (random read on HDD)
2. Sequential workload: 100MB (contiguous sectors)

$$T_{I/O} = T_{seek} + T_{rotation} + T_{transfer}$$

$$T_{transfer} = Data_{size}\ x\ Rate_{I/O}$$

$$R_{I/O} = \frac{Size_{Transfer}}{T_{I/O}}$$

		Cheetah 15K.5	Barracuda
T_{seek}		4 ms	9 ms
$T_{rotation}$		2 ms	4.2 ms
4 KB Random	$T_{transfer}$	30 microsecs	38 microsecs
	$T_{I/O}$	6 ms	13.2 ms
	$R_{I/O}$	0.66 MB/s	0.31 MB/s
100 MB Sequential	$T_{transfer}$	800 ms	950 ms
	$T_{I/O}$	806 ms	963.2 ms
	$R_{I/O}$	125 MB/s	105 MB/s

Disk Drive Performance: SCSI Versus SATA

There is a huge gap in drive throughput between random and sequential workloads

99

MODERN HDD SPECS

- See sample HDD configurations here:
  - Up to 20 TB
- https://www.westerndigital.com/products/data-center-drives#hard-disk-hdd

100

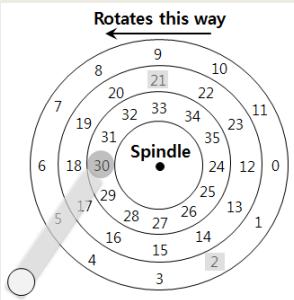
DISK SCHEDULING

- Disk scheduler: determine how to order I/O requests
- Multiple levels - OS and HW
- OS: provides ordering
- HW: further optimizes using intricate details of physical HDD implementation and state

101

SSTF – SHORTEST SEEK TIME FIRST

- Disk scheduling – which I/O request to schedule next
- Shortest Seek Time First (SSTF)
- Order queue of I/O requests by nearest track



SSTF: Scheduling Request 21 and 2
Issue the request to 21 → issue the request to 2

102

SSTF ISSUES

- Problem 1: HDD abstraction
- Drive geometry not available to OS. Nearest-block-first is a comparable alternate algorithm.
- Problem 2: Starvation
- Steady stream of requests for local tracks may prevent arm from traversing to other side of platter

103

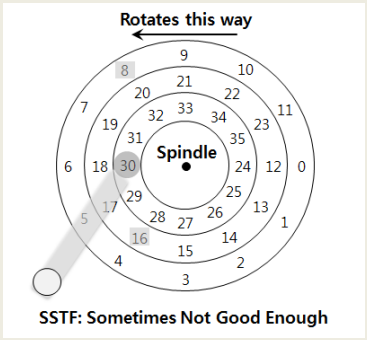
DISK SCHEDULING ALGORITHMS

- **SCAN (SWEEP)**
- Perform single repeated passes back and forth across disk
- Issue: if request arrives for a recently visited track it will not be revisited until a full cycle completes
- **F-SCAN**
- Freeze incoming requests by adding to queue during scan
- Cache arriving requests until later
- Delays help avoid starvation by postponing servicing nearby newly arriving requests vs. requests at edge of sweep
- Provides better fairness
- **Elevator (C-SCAN)** – circular scan
- Sweep only one direction (e.g. outer to inner) and repeat
- SCAN favors middle tracks vs. outer tracks with 2-way sweep

104

SHORTEST TIME POSITIONING FIRST

- Determine next sector to read?
  - Where: $T_{seek} = T_{rotation}$
- On which track?
- On which sector?



On modern drives, both seek and rotation are roughly equivalent:
Thus, SPTF (Shortest Positioning Time First) is useful.

105

OPTIMIZATION: I/O MERGING

- Group temporary adjacent requests
- Reduce overhead
- Read (memory blocks): 33 8 34
- How long we should wait for I/O ?
- When do we know we have waited too long?

106

QUESTIONS

107
