Institute of Technology, University of Washington - Tacoma

FEEDBACK FROM 1/11

- Can you go more in depth about Jain's Fairness Index? If Jain's index is .333, what does that mean?
- Consider the formula:

$$J(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n x_i)^2}{n \cdot \sum_{i=1}^n x_i^2}$$
- Now consider an example of 3 jobs.
 - Job A and Job B receive 10% of the available CPU time.
 - Job C receives 80% of the CPU time, for a total of 100%
 - JA (.1) + JB (.1) + JC (.8) = 1.0 total time
- What is Jain's Index?
- How does this relate to .33? Is this example better or worse?

L4.2

FEEDBACK - 2

- What is the difference between a maskable vs. non-maskable interrupt?
- Interrupts are produced by **hardware**, and are different than system calls or exceptions (**software**)...

Maskable Interrupt	Non-maskable Interrupt
Can be masked (queued)	Cannot be masked (queued)
Processing can be delayed	Processing is immediate
Lower priority than non-maskable interrupts	Higher priority than maskable interrupts
Response time is high	Response time is low
Example: Peripherals (keyboard, mouse), I/O	Emergency: RAM failure, HDD failure, power failure

Institute of Technology, University of Washington - Tacoma
L4.3

FEEDBACK - 3

- What does it mean by "job arrival"?
 - For scheduling questions we will often state job arrival times for the purpose of calculating scheduling metric results such as Average Response Time, Average Turnaround Time, etc.
- What is the setting "ONBOOT=no" for?
Under: `/etc/sysconfig/network-scripts/ifcfg-enp0s3`
- Used to automatically start the network adapter on the virtual machine when the CentOS VM boots up
 - If disabled, network won't automatically initialize

L4.4

OBJECTIVES

- Scheduling Methods: Round Robin (Ch. 7)
- Multi-level Feedback Queue (Ch. 8)

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.5

RR: ROUND ROBIN

- Run each job awhile, then switch to another distributing the CPU evenly (fairly)
- Scheduling Quantum is called a time slice
- Time a m... timer interrupt period.

RR is fair, but performs poorly on metrics such as turnaround time

Process	Burst Time
P1	12
P5	5

Round Robin scheduling algorithm Gantt chart

Scheduling Quantum = 5 seconds

P1	P2	P3	P4	P5	P1	P2	P4	P1
0	5	10	14	19	24	29	32	37

39

TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.6

RR EXAMPLE

- ABC arrive at time=0, each run for 5 seconds

OVERHEAD not considered

$$T_{average\ response} = \frac{0 + 5 + 10}{3} = 5sec$$

SJF (Bad for Response Time)

$$T_{average\ response} = \frac{0 + 1 + 2}{3} = 1sec$$

RR with a time-slice of 1sec (Good for Response Time)

January 18, 2017 TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma L4.7

ROUND ROBIN: TRADEOFFS

Short Time Slice

Fast Response Time

High overhead from context switching

↔

Long Time Slice

Slow Response Time

Low overhead from context switching

- Time slice impact:
 - Average turnaround time: $ts(1,2,3,4,5)=14,14,13,14,10$
 - Fairness: round robin is always fair, $J=1$

January 18, 2017 TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma L4.8

SCHEDULING WITH I/O

- STCF scheduler
 - A: CPU=50ms, I/O=40ms, 10ms intervals
 - B: CPU=50ms, I/O=0ms
 - Consider A as 10ms subjobs (CPU, then I/O)
- Without considering I/O:

Cpu utilization = $100/140=71\%$

Poor Use of Resources

January 18, 2017 TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma L4.9

SCHEDULING WITH I/O - 2

- When a job initiates an I/O request
 - A is blocked, waits for I/O to complete, frees CPU
 - STCF scheduler assigns B to CPU
- When I/O completes → raise interrupt
 - Unblock A, STCF goes back to executing A: (10ms sub-job)

Cpu utilization = $100/100=100\%$

Overlap Allows Better Use of Resources

Institute of Technology, University of Washington - Tacoma L4.10

MULTI-LEVEL FEEDBACK QUEUE (MLFQ) SCHEDULER

January 11, 2017 TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma L4.11

MULTI-LEVEL FEEDBACK QUEUE

- Objectives:
 - Improve turnaround time:
Run shorter jobs first
 - Minimize response time:
Important for interactive jobs (UI)
- Achieve without a priori knowledge of job length

January 18, 2017 TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma L4.12

MLFQ - 2

Round-Robin within a Queue

- Multiple job queues
- Adjust job priority based on observed behavior
 - Frequent I/O → keep priority high
 - Interactive jobs require fast response time (GUI/UI)
- Batch Jobs
 - Require long periods of CPU utilization
 - Keep priority low

[High Priority] Q8 → A → B

Q7

Q6

Q5

Q4 → C

Q3

Q2

[Low Priority] Q1 → D

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.13

MLFQ: DETERMINING JOB PRIORITY

- New arriving jobs are placed into highest priority queue
- If a job uses its entire time slice, priority is reduced (↓)
 - Jobs appears CPU-bound ("batch" job), not interactive (GUI/UI)
- If a job relinquishes the CPU for I/O priority stays the same

MLFQ approximates SJF

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.14

MLFQ: LONG RUNNING JOB

- Three-queue scheduler, time slice=10ms

Long-running Job Over Time (msec)

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.15

MLFQ: BATCH AND INTERACTIVE JOBS

- A_{arrival_time}=0ms, A_{run_time}=200ms,
- B_{run_time}=20ms, B_{arrival_time}=100ms

Scheduling multiple jobs (ms)

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.16

MLFQ: BATCH AND INTERACTIVE - 2

- Continuous interactive job (B) with long running batch job (A)
 - Low response time is good for B
 - A continues to make progress

The MLFQ approach keeps interactive job(s) at the highest priority

A Mixed I/O-intensive and CPU-intensive Workload (msec)

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.17

MLFQ: ISSUES

- Starvation

CPU bound batch job(s)

January 18, 2017
TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma
L4.18

MLFQ: ISSUES - 2

- Gaming the scheduler
 - Issue I/O operation at 99% completion of the time slice
 - Keeps job priority fixed – never lowered
- Job behavioral change
 - CPU/batch process becomes an interactive process

January 18, 2017

TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma

L4.19

RESPONDING TO BEHAVIOR CHANGE

- Priority Boost
 - Reset all jobs to topmost queue after some time interval S

January 18, 2017

TCSS422: Operating Systems [Winter 2017]
Institute of Technology, University of Washington - Tacoma

L4.20

RESPONDING TO BEHAVIOR CHANGE - 2

- With priority boost
 - Prevents starvation

January 18, 2017
