Institute of Technology, University of Washington - Tacoma

L11.2

FEEDBACK FROM 2/12

- Are device drivers implemented as kernel modules?
- Device drivers are frequently built as kernel modules:
- See: <http://derekmolloy.ie/writing-a-linux-kernel-module-part-2-a-character-device/>
- Required drivers can loaded on demand to support running on various hardware configurations.
- To see list of device drivers:
 - `cd /lib/modules/$(uname -r)`
 - `find . | grep ko`
- To count the number of drivers:
 - `find . | grep ko | wc -l`

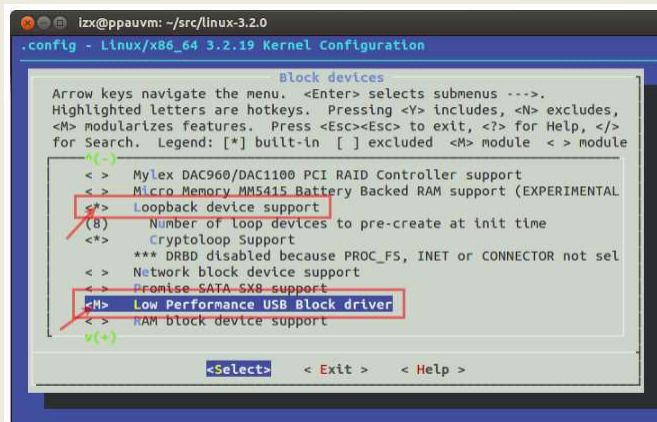

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.3

FEEDBACK - 2

- Alternatively, device drivers can be integrated into the Linux kernel.
- Some drivers are provided natively (e.g. loopback device driver)
- Linux kernel can be rebuilt to automatically include device drivers:

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.4

FEEDBACK - 3

- Are kernel modules only run when accessed via the procfile interface, or do they also have a main/background thread/process?
- It depends on the kernel module.
- A basic kernel module with only a read or write callback function that doesn't actively perform other tasks will sleep until a user performs I/O on the /proc file
- When I/O is performed a [kworker] process traps the event and calls the callback function
- See:
- <https://www.ibm.com/developerworks/library/l-proc/index.html>
- Google search: "linux proc read callback"

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.5

FEEDBACK - 4

- If the bounded buffer example (signal.c) used a data structure for multiple matrices (queue/stack), would you use that data structure's size as a "ready" variable?
- A bounded buffer is similar to a queue
- Elements are added at the front, and retrieved from the tail.
- If the data structure is "bounded" (i.e. has a fixed size) then:
 - We can only **ADD** items to *QUEUE* if there is free capacity
 - Can only **REMOVE** items from *QUEUE* if there's content to "consume"

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.6

CHAPTER 30 – CONDITION VARIABLES

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.7

MATRIX GENERATOR

Matrix generation example

Chapter 30
signal.c

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.8

MATRIX GENERATOR

- The main thread, and worker thread (generates matrices) share a single matrix pointer.
- What would happen if we don't use a condition variable to coordinate exchange of the lock?
- Let's try "nosignal.c"

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.9

SUBTLE RACE CONDITION: WITHOUT A WHILE

```
1  void thr_exit() {
2      done = 1;
3      pthread_cond_signal(&c);
4  }
5
6  void thr_join() {
7      if (done == 0)
8          pthread_cond_wait(&c);
9  }
```

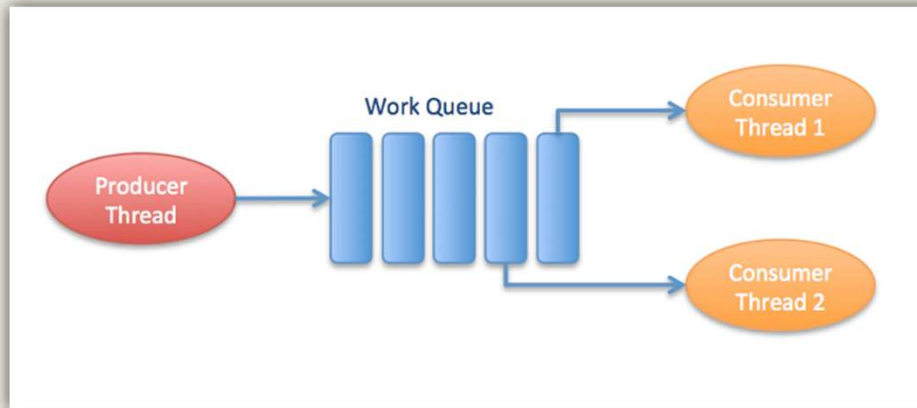

- Parent thread calls thr_join() and executes the comparison
- The context switches to the child
- The child runs thr_exit() and signals the parent, but the parent is not waiting yet.
- The signal is lost
- The parent deadlocks

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.10

PRODUCER / CONSUMER

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.11

PRODUCER / CONSUMER

■ Producer

- Produces items – consider the child matrix maker
- Places them in a buffer
 - Example: the buffer is only 1 element (single array pointer)

■ Consumer

- Grabs data out of the buffer
- Our example: parent thread receives dynamically generated matrices and performs an operation on them
 - Example: calculates average value of every element (integer)

■ Multithreaded web server example

- Http requests placed into work queue; threads process

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.12

PRODUCER / CONSUMER - 2

- Producer / Consumer is also known as **Bounded Buffer**
- Bounded buffer
 - Similar to piping output from one Linux process to another
 - `grep pthread signal.c | wc -l`
 - Synchronized access:
sends output from `grep` → `wc` as it is produced
 - File stream

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.13

PUT/GET ROUTINES

- Buffer is a one element shared data structure (int)
- Producer “puts” data
- Consumer “gets” data
- Shared data structure requires synchronization

```
1  int buffer;  
2  int count = 0;  // initially, empty  
3  
4  void put(int value) {  
5      assert(count == 0);  
6      count = 1;  
7      buffer = value;  
8  }  
9  
10 int get() {  
11     assert(count == 1);  
12     count = 0;  
13     return buffer;  
14 }
```

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.14

PRODUCER / CONSUMER - 3

- Producer adds data
- Consumer removes data (busy waiting)
- Will this code work (spin locks) with 2-threads?

1. Producer 2. Consumer

```

1  void *producer(void *arg) {
2      int i;
3      int loops = (int) arg;
4      for (i = 0; i < loops; i++) {
5          put(i);
6      }
7  }
8
9  void *consumer(void *arg) {
10     int i;
11     while (1) {
12         int tmp = get();
13         printf("%d\n", tmp);
14     }
15 }
```

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.15

PRODUCER / CONSUMER - 3

- The shared data structure needs synchronization!

```

1  cond_t cond;
2  mutex_t mutex;
3
4  void *producer(void *arg) {
5      int i;
6      for (i = 0; i < loops; i++) {
7          pthread_mutex_lock(&mutex);
8          if (count == 1)
9              pthread_cond_wait(&cond, &mutex);
10         put(i);
11         pthread_cond_signal(&cond);
12         pthread_mutex_unlock(&mutex);
13     }
14 }
15
16 void *consumer(void *arg) {
17     int i;
18     for (i = 0; i < loops; i++) {
19         pthread_mutex_lock(&mutex);
20     }
```

Producer

// p1
// p2
// p3
// p4
// p5
// p6

// c1

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.16

PRODUCER/CONSUMER - 4

```
20         if (count == 0)                // c2
21             Pthread_cond_wait(&cond, &mutex);    // c3
22         int tmp = get();                // c4
23             Pthread_cond_signal(&cond);        // c5
24             Pthread_mutex_unlock(&mutex);      // c6
25             printf("%d\n", tmp);
26     }
27 }
```

Consumer

■ This code as-is works with just:

(1) Producer

(1) Consumer

■ If we scale to (2+) consumer's it fails

■ How can it be fixed ?

February 14, 2018

TCCS422: Operating Systems [Winter 2018]

TCCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.18

PRODUCER/CONSUMER
SYNCHRONIZATION

- When producer threads awake, they do not check if there is any data in the buffer...
 - Need while, not if
- What if T_p puts a value, wakes T_{c1} whom consumes the value
- Then T_p has a value to put, but T_{c1} 's signal on `&cond` wakes T_{c2}
- There is nothing for T_{c2} consume, so T_{c2} sleeps
- T_{c1} , T_{c2} , and T_p all sleep forever
- T_{c1} needs to wake T_p to T_{c2}

Institute of Technology, University of Washington - Tacoma

L11.21

TWO CONDITIONS

Use two condition variables: empty & full

One condition handles the producer

the other the consumer

1 cond t empty, full;
2 mutex_t mutex;

3

4 void *producer(void *arg) {

5 int i;

6 for (i = 0; i < loops; i++) {

7 pthread_mutex_lock(&mutex);

8 while (count == 1)

9 pthread_cond_wait(&empty, &mutex);

10 put(i);

11 pthread_cond_signal(&full);

12 pthread_mutex_unlock(&mutex);

13 }

14 }

15 }

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.22

FINAL PRODUCER/CONSUMER

- Change buffer from int, to int buffer[MAX]
- Add indexing variables

```

1  int buffer[MAX];
2  int fill = 0;
3  int use = 0;
4  int count = 0;
5
6  void put(int value) {
7      buffer[fill] = value;
8      fill = (fill + 1) % MAX;
9      count++;
10 }
11
12 int get() {
13     int tmp = buffer[use];
14     use = (use + 1) % MAX;
15     count--;
16     return tmp;
17 }

```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.23

FINAL P/C - 2

```

1  → cond_t empty, full
2  mutex_t mutex;
3
4  void *producer(void *arg) {
5      int i;
6      for (i = 0; i < loops; i++) {
7          pthread_mutex_lock(&mutex);           // p1
8          while (count == MAX)                  // p2
9              pthread_cond_wait(&empty, &mutex); // p3
10         put(i);                                // p4
11         pthread_cond_signal(&full);            // p5
12         pthread_mutex_unlock(&mutex);          // p6
13     }
14 }
15
16 void *consumer(void *arg) {
17     int i;
18     for (i = 0; i < loops; i++) {
19         pthread_mutex_lock(&mutex);           // c1
20         while (count == 0)                    // c2
21             pthread_cond_wait(&full, &mutex); // c3
22         int tmp = get();                      // c4

```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.24

FINAL P/C - 3

```
(Cont.)
23      pthread_cond_signal(&empty);           // c5
24      pthread_mutex_unlock(&mutex);          // c6
25      printf("%d\n", tmp);
26      }
27      }
```

- **Producer: only sleeps when buffer is full**
- **Consumer: only sleeps if buffers are empty**

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.25

COVERING CONDITIONS

- **A condition that covers all cases (conditions):**
 - **Excellent use case for `pthread_cond_broadcast`**
 - **Consider memory allocation:**
 - **When a program deals with huge memory allocation/deallocation on the heap**
 - **Access to the heap must be managed when memory is scarce**
- PREVENT: Out of memory:**
- queue requests until memory is free
- **Which thread should be woken up?**

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.26

COVERING CONDITIONS - 2

```

1  // how many bytes of the heap are free?
2  int bytesLeft = MAX_HEAP_SIZE;
3
4  // need lock and condition too
5  cond_t c;
6  mutex_t m;
7
8  void *
9  allocate(int size) {
10     pthread_mutex_lock(&m);
11     while (bytesLeft < size)
12         pthread_cond_wait(&c, &m);
13     void *ptr = ...; // get mem from heap
14     bytesLeft -= size;
15     pthread_mutex_unlock(&m);
16     return ptr;
17 }
18
19 void free(void *ptr, int size) {
20     pthread_mutex_lock(&m);
21     bytesLeft += size;
22     pthread_cond_signal(&c); // Broadcast
23     pthread_mutex_unlock(&m);
24 }

```

Check available memory

Broadcast

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.27

COVER CONDITIONS - 3

- Broadcast awakens all blocked threads requesting memory
- Each thread evaluates if there's enough memory: (bytesLeft < size)
 - Reject: requests that cannot be fulfilled- go back to sleep
 - *Insufficient memory*
 - Run: requests which can be fulfilled
 - with newly available memory!
- Overhead
 - Many threads may be awoken which can't execute

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.28

CHAPTER 32 – CONCURRENCY PROBLEMS

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.29

OBJECTIVES

- Chapter 32:
 - Non-deadlock concurrency bugs
 - Deadlock causes
 - Deadlock prevention

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.30

CONCURRENCY BUGS IN OPEN SOURCE SOFTWARE

- “Learning from Mistakes – A Comprehensive Study on Real World Concurrency Bug Characteristics”
 - Shan Lu et al.
 - Architectural Support For Programming Languages and Operating Systems (ASPLOS 2008), Seattle WA

Application	What it does	Non-Deadlock	Deadlock
MySQL	Database Server	14	9
Apache	Web Server	13	4
Mozilla	Web Browser	41	16
Open Office	Office Suite	6	2
Total		74	31

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.31

NON-DEADLOCK BUGS

- Majority of concurrency bugs
- Most common:
 - Atomicity violation: forget to use locks
 - Order violation: failure to initialize lock/condition before use

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.32

ATOMICITY VIOLATION - MYSQL

- Two threads access the `proc_info` field in `struct thd`
- `NULL` is 0 in C
- Serialized access to shared memory among separate threads is not enforced (e.g. non-atomic)
- Simple example:

Programmer intended
variable to be accessed
atomically...

```

1  Thread1::
2  if(thd->proc_info){
3      ...
4      fputs(thd->proc_info , ...);
5      ...
6  }
7
8  Thread2::
9  thd->proc_info = NULL;
    
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.33

ATOMICITY VIOLATION - SOLUTION

- Add locks for all uses of: `thd->proc_info`

```

1  pthread_mutex_t lock = PTHREAD_MUTEX_INITIALIZER;
2
3  Thread1::
4  pthread_mutex_lock(&lock);
5  if(thd->proc_info){
6      ...
7      fputs(thd->proc_info , ...);
8      ...
9  }
10 pthread_mutex_unlock(&lock);
11
12 Thread2::
13 pthread_mutex_lock(&lock);
14 thd->proc_info = NULL;
15 pthread_mutex_unlock(&lock);
    
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.34

ORDER VIOLATION BUGS

- Desired order between memory accesses is flipped
- E.g. something is checked before it is set
- Example:

```

1  Thread1::
2  void init(){
3      mThread = PR_CreateThread(mMain, ...);
4  }
5
6  Thread2::
7  void mMain(...){
8      mState = mThread->State
9  }

```

- What if mThread is not initialized?

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.35

ORDER VIOLATION - SOLUTION

- Use condition variable to enforce order

```

1  pthread_mutex_t mtLock = PTHREAD_MUTEX_INITIALIZER;
2  pthread_cond_t mtCond = PTHREAD_COND_INITIALIZER;
3  int mtInit = 0;
4
5  Thread 1::
6  void init(){
7      ...
8      mThread = PR_CreateThread(mMain,...);
9
10     // signal that the thread has been created.
11     pthread_mutex_lock(&mtLock);
12     mtInit = 1;
13     pthread_cond_signal(&mtCond);
14     pthread_mutex_unlock(&mtLock);
15     ...
16 }
17
18 Thread2::
19 void mMain(...){
20     ...

```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.36

ORDER VIOLATION – SOLUTION 2

```
21 // wait for the thread to be initialized ...
22 pthread_mutex_lock(&mtLock);
23 while(mtInit == 0)
24     pthread_cond_wait(&mtCond, &mtLock);
25 pthread_mutex_unlock(&mtLock);
26
27 mState = mThread->State;
28 ...
29 }
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.37

NON-DEADLOCK BUGS - 1

- 97% of Non-Deadlock Bugs were
 - Atomicity
 - Order violations
- Consider what is involved in “spotting” these bugs in code
- Desire for automated tool support (IDE)

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.38

NON-DEADLOCK BUGS - 2

■ Atomicity

- How can we tell if a given variable is shared?
 - Can search the code for uses
- How do we know if all instances of its use are shared?
 - Can some non-synchronized (non-atomic) uses be legal?
 - Before threads are created, after threads exit
 - Must verify the scope

■ Order violation

- Must consider all variable accesses
- Must know desired order

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.39

DEADLOCK BUGS

- Presence of a cycle in code
- Thread 1 acquires lock L1, waits for lock L2
- Thread 2 acquires lock L2, waits for lock L1

Thread 1:	Thread 2:
<code>lock (L1);</code>	<code>lock (L2);</code>
<code>lock (L2);</code>	<code>lock (L1);</code>

- Both threads can block, unless one manages to acquire both locks

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.40

REASONS FOR DEADLOCKS

- **Complex code**
 - Must avoid circular dependencies – can be hard to find...
- **Encapsulation hides potential locking conflicts**
 - Easy-to-use APIs embed locks inside
 - Programmer doesn't know they are there
 - Consider the Java Vector class:

```
1 Vector v1,v2;
2 v1.AddAll(v2);
```

- Vector is thread safe (synchronized) by design
- If there is a v2.AddAll(v1); call at nearly the same time deadlock could result

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.41

CONDITIONS FOR DEADLOCK

- Four conditions are required for dead lock to occur

Condition	Description
➡ Mutual Exclusion	Threads claim exclusive control of resources that they require.
Hold-and-wait	Threads hold resources allocated to them while waiting for additional resources
No preemption	Resources cannot be forcibly removed from threads that are holding them.
Circular wait	There exists a circular chain of threads such that each thread holds one more resources that are being requested by the next thread in the chain

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.42

PREVENTION – MUTUAL EXCLUSION

- Build wait-free data structures
 - Eliminate locks altogether
 - Build structures using CompareAndSwap atomic CPU (HW) instruction
- C pseudo code for CompareAndSwap
- Hardware executes this code atomically

```
1  int CompareAndSwap(int *address, int expected, int new){
2      if(*address == expected){
3          *address = new;
4          return 1; // success
5      }
6      return 0;
7  }
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.43

PREVENTION – MUTUAL EXCLUSION - 2

- Recall atomic increment

```
1  void AtomicIncrement(int *value, int amount){
2      do{
3          int old = *value;
4      }while( CompareAndSwap(value, old, old+amount)!=0);
5  }
```

- Compare and Swap tries over and over until successful
- CompareAndSwap is guaranteed to be atomic
- When it runs it is **ALWAYS** atomic (at HW level)

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.44

MUTUAL EXCLUSION: LIST INSERTION

■ Consider list insertion

```
1 void insert(int value){
2     node_t * n = malloc(sizeof(node_t));
3     assert( n != NULL );
4     n->value = value ;
5     n->next = head;
6     head    = n;
7 }
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.45

MUTUAL EXCLUSION – LIST INSERTION - 2

■ Lock based implementation

```
1 void insert(int value){
2     node_t * n = malloc(sizeof(node_t));
3     assert( n != NULL );
4     n->value = value ;
5     lock(listlock); // begin critical section
6     n->next = head;
7     head    = n;
8     unlock(listlock); //end critical section
9 }
```

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.46

MUTUAL EXCLUSION – LIST INSERTION - 3

■ Wait free (no lock) implementation

```

1 void insert(int value) {
2     node_t *n = malloc(sizeof(node_t));
3     assert(n != NULL);
4     n->value = value;
5     do {
6         n->next = head;
7     } while (!CompareAndSwap(&head, n->next, n));
8 }

```

■ Assign &head to n (new node ptr)

■ Only when head = n->next

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.47

CONDITIONS FOR DEADLOCK

■ Four conditions are required for dead lock to occur

Condition	Description
Mutual Exclusion	Threads claim exclusive control of resources that they require.
Hold-and-wait	Threads hold resources allocated to them while waiting for additional resources
No preemption	Resources cannot be forcibly removed from threads that are holding them.
Circular wait	There exists a circular chain of threads such that each thread holds one more resources that are being requested by the next thread in the chain

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.48

PREVENTION – HOLD AND WAIT

- Problem: acquire all locks atomically
- Solution: use a “lock” “lock”... (like a guard lock)

```
1 lock(prevention);
2 lock(L1);
3 lock(L2);
4 ...
5 unlock(prevention);
```

- Effective solution – guarantees no race conditions while acquiring L1, L2, etc.
- Order doesn't matter for L1, L2
- Prevention (GLOBAL) lock decreases concurrency of code
 - Acts Lowers lock granularity
- Encapsulation: consider the Java Vector class...

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.49

CONDITIONS FOR DEADLOCK

- Four conditions are required for dead lock to occur

Condition	Description
Mutual Exclusion	Threads claim exclusive control of resources that they require.
Hold-and-wait	Threads hold resources allocated to them while waiting for additional resources
→ No preemption	Resources cannot be forcibly removed from threads that are holding them.
Circular wait	There exists a circular chain of threads such that each thread holds one more resources that are being requested by the next thread in the chain

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.50

PREVENTION – NO PREEMPTION

- When acquiring locks, don't BLOCK forever if unavailable...
- `pthread_mutex_trylock()` - try once
- `pthread_mutex_timedlock()` - try and wait awhile

```
1 top:
2   lock(L1);
3   if( tryLock(L2) == -1 ){
4       unlock(L1);
5       goto top;
6   }
```

- Eliminates deadlocks

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.51

NO PREEMPTION – LIVELOCKS PROBLEM

- Can lead to livelock

```
1 top:
2   lock(L1);
3   if( tryLock(L2) == -1 ){
4       unlock(L1);
5       goto top;
6   }
```

- Two threads execute code in parallel → always fail to obtain both locks
- Add random delay
 - Allows one thread to win livelock race!

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.52

CONDITIONS FOR DEADLOCK

- **Four conditions** are required for dead lock to occur

Condition	Description
Mutual Exclusion	Threads claim exclusive control of resources that they require.
Hold-and-wait	Threads hold resources allocated to them while waiting for additional resources
No preemption	Resources cannot be forcibly removed from threads that are holding them.
Circular wait	There exists a circular chain of threads such that each thread holds one more resources that are being requested by the next thread in the chain

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.53

PREVENTION – CIRCULAR WAIT

- **Provide total ordering of lock acquisition throughout code**
 - Always acquire locks in same order
 - L1, L2, L3, ...
 - Never mix: L2, L1, L3; L2, L3, L1; L3, L1, L2....
- **Must carry out same ordering through entire program**

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.54

DEADLOCK AVOIDANCE VIA INTELLIGENT SCHEDULING

- Consider a smart scheduler
 - Scheduler knows which locks threads use
- Consider this scenario:
 - 4 Threads (T1, T2, T3, T4)
 - 2 Locks (L1, L2)
- Lock requirements of threads:

	T1	T2	T3	T4
L1	yes	yes	no	no
L2	yes	yes	yes	no

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.55

INTELLIGENT SCHEDULING - 2

- Scheduler produces schedule:

CPU 1	T3	T4
CPU 2	T1	T2

- No deadlock can occur
- Consider:

	T1	T2	T3	T4
L1	yes	yes	yes	no
L2	yes	yes	yes	no

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.56

INTELLIGENT SCHEDULING - 3

- Scheduler produces schedule

CPU 1

T4

CPU 2

T1

T2

T3

- Scheduler must be conservative and not take risks
- Slows down execution – many threads
- There has been limited use of these approaches given the difficulty having intimate lock knowledge about every thread

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.57

DETECT AND RECOVER

- Allow deadlock to occasionally occur and then take some action.
 - Example: When OS freezes, reboot...
- How often is this acceptable?
- Many database systems employ deadlock detection and recovery techniques.

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.58

CHAPTER 13: ADDRESS SPACES

February 14, 2018

Institute of Technology, University of Washington - Tacoma

L11.59

OBJECTIVES

- Chapter 13
 - Introduction to memory virtualization
 - The address space
 - Goals of OS memory virtualization
- Chapter 14
 - Memory API
 - Common memory errors
- Chapter 15
 - Address translation
 - Base and bounds
 - HW and OS Support
- Chapter 16
 - Memory segments, fragmentation

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.60

MEMORY VIRTUALIZATION

- What is memory virtualization?
- This is not “virtual” memory,
 - Classic use of disk space as additional RAM
 - When available RAM was low
 - Less common recently

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.61

MEMORY VIRTUALIZATION - 2

- Presentation of system memory to each process
- Appears as if each process can access the entire machine's address space
- Each process's view of memory is isolated from others
- Everyone has their own sandbox

Process A

Process B

Process C

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.62

MOTIVATION FOR
MEMORY VIRTUALIZATION

- Easier to program
 - Programs don't need to understand special memory models
- Abstraction enables sophisticated approaches to manage and share memory among processes
- Isolation
 - From other processes: easier to code
- Protection
 - From other processes
 - From programmer error (segmentation fault)

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.63

EARLY MEMORY MANAGEMENT

- Load one process at a time into memory
- Poor memory utilization
- Little abstraction

0KB
64KB
max
Physical Memory

Operating System
(code, data, etc.)

Current Program
(code, data, etc.)

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.64

MULTIPROGRAMMING WITH SHARED MEMORY

- Later machines supported running multiple processes
- Swap out processes during I/O waits to increase system utilization and efficiency
- Swap entire memory of a process to disk for context switch
- Too slow, especially for large processes
- Solution →
 - Leave processes in memory
- Need to protect from errant memory accesses in a multiprocessing environment

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.65

ADDRESS SPACE

- Easy-to-use abstraction of physical memory for a process
- Main elements:
 - Program code
 - Stack
 - Heap
- Example: 16KB address space

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.66

ADDRESS SPACE - 2

- **Code**
 - Program code
- **Stack**
 - Program counter (PC)
 - Local variables
 - Parameter variables
 - Return values (for functions)
- **Heap**
 - Dynamic storage
 - Malloc() new()

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.67

ADDRESS SPACE - 3

- **Program code**
 - Static size
- **Heap and stack**
 - Dynamic size
 - Grow and shrink during program execution
 - Placed at opposite ends
- **Addresses are virtual**
 - They must be physically mapped by the OS

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.68

VIRTUAL ADDRESSING

- Every address is virtual
 - OS translates virtual to physical addresses

```
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[]){

    printf("location of code : %p\n", (void *) main);
    printf("location of heap : %p\n", (void *) malloc(1));
    int x = 3;
    printf("location of stack : %p\n", (void *) &x);

    return x;
}
```

■ EXAMPLE: virtual.c

February 14, 2018

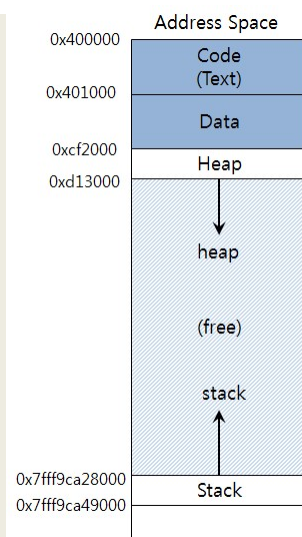

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.69

VIRTUAL ADDRESSING - 2

- Output from 64-bit Linux:

location of code: 0x400686
location of heap: 0x1129420
location of stack: 0x7ffe040d77e4

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.70

GOALS OF OS MEMORY VIRTUALIZATION

- **Transparency**
 - Memory shouldn't appear virtualized to the program
 - OS multiplexes memory among different jobs behind the scenes
- **Protection**
 - Isolation among processes
 - OS itself must be isolated
 - One program should not be able to affect another (or the OS)

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.71

GOALS - 2

- **Efficiency**
 - **Time**
 - Performance: virtualization must be fast
 - **Space**
 - Virtualization must not waste space
 - Consider data structures for organizing memory
 - Hardware support TLB: Translation Lookaside Buffer
- **Goals considered when evaluation memory virtualization schemes**

February 14, 2018

TCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.72

CHAPTER 14: THE MEMORY API

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.73

MALLOC

```
#include <stdlib.h>

void* malloc(size_t size)
```

- Allocates memory on the heap
- `size_t` unsigned integer (must be +)
- `size` size of memory allocation in bytes
- Returns
 - SUCCESS: A void * to a memory address
 - FAIL: NULL
- `sizeof()` often used to ask the system how large a given datatype or struct is

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.74

sizeof()

- Not safe to assume data type sizes using different compilers, systems
- Dynamic array of 10 ints
- Static array of 10 ints

```
int *x = malloc(10 * sizeof(int));  
printf("%d\n", sizeof(x));
```

4

```
int x[10];  
printf("%d\n", sizeof(x));
```

40

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.75

FREE()

```
#include <stdlib.h>  
  
void free(void* ptr)
```

- Free memory allocated with malloc()
- Provide: (void *) ptr to malloc'd memory
- Returns: nothing

February 14, 2018

TCSS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.76

VIRTUAL ADDRESS SPACE

```
int *pi; // local variable
```

- Pointer is a local variable on the stack

```
pi = (int *)malloc(sizeof(int) * 4);
```

- Malloc returns space on the heap

2KB
(free)
16KB
Address Space

2KB
2KB + 4 allocated
2KB + 8 allocated
2KB + 12 allocated
(free)
2KB
16KB

L11.78

COMMON MEMORY ERRORS

- Forgetting to malloc memory
- Unterminated string
- Uninitialized memory
- Memory leak
- Dangling pointer

February 14, 2018

TCCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.79

FORGETTING TO MALLOC

- C is not Java
- When forgetting to malloc:

```
char *src = "hello"; //character string constant
char *dst;           //unallocated
strcpy(dst, src);    //segfault and die
```

dst has not been initialized.
It has no place to store anything

strcpy(dst, src);

Segmentation fault (core dumped)

February 14, 2018

TCCS422: Operating Systems [Winter 2018]
Institute of Technology, University of Washington - Tacoma

L11.80

CORRECTION

```
char *src = "hello"; //character string constant
char *dst (char *)malloc(strlen(src) + 1 ); // allocated
strcpy(dst, src); //work properly
```

Why do we malloc length + 1 ?

strcpy(dst, src);

helloW0

allocated

heap (free)

stack

*dst

*src

L11.84

```
#include<stdio.h>
```

What will this code do?

```
int * set_magic_number_a()
{
    int a =53247;
    return &a;
}

void set_magic_number_b()
{
    int b = 11111;
}

int main()
{
    int * x = NULL;
    x = set_magic_number_a();
    printf("The magic number is=%d\n",*x);
    set_magic_number_b();
    printf("The magic number is=%d\n",*x);
    return 0;
}
```

85

```
#include<stdio.h>
```

What will this code do?

```
int * set_magic_number_a()
{
    int a =53247;
    return &a;
}

void set_magic_number_b()
{
    int b = 11111;
}

int main()
{
    int * x = NULL;
    x = set_magic_number_a();
    printf("The magic number is=%d\n",*x);
    set_magic_number_b();
    printf("The magic number is=%d\n",*x);
    return 0;
}
```

Output:

```
$ ./pointer_error
The magic number is=53247
The magic number is=11111
```

We have not changed *x but
the value has changed!!

Why?

86
