

# TCSS 422: OPERATING SYSTEMS

**Address Translation,  
Segmentation,  
Free Space Management,  
Intro to Paging**

**Wes J. Lloyd**  
School of Engineering and Technology  
University of Washington - Tacoma

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

## OBJECTIVES

- Mon 3/11 (4pm): Husky Alumni Visit from T-Mobile Q&A  
CS work life after graduation – room TBA
- Wed 3/13: Prof. Mohamed Ali- UWT CSS Grad Program
- Assignment 2
- Active Reading Quiz Posted – Chapter 19
- Assignment 3
- Memory Virtualization
- Chapter 15 – Address Translation
- Chapter 16 – Segmentation
- Chapter 17 – Free Space Management
- Chapter 18 – Introduction to Paging
- Chapter 19 – Translation Lookaside Buffer (TLB)

March 4, 2019	TCSS422: Operating Systems [Winter 2019] School of Engineering and Technology, University of Washington - Tacoma	L13.2
---------------	---	-------

## FEEDBACK FROM 2/27

- Can we schedule producers / consumers to run on different CPU cores?
- Yes, see Sloppy Counter example from Ch. 29 which create pthreads and assigns them to fixed CPU cores
- Uses `sched_setaffinity()` API call
- <http://faculty.washington.edu/wlloyd/courses/tcss422/examples/Chapter29/sloppy.c>
- Does realloc() overwrite the header?
- Realloc() should rewrite (update) the header with any information that has changed

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.3

## FEEDBACK - 2

- Can we get an extension on our HW 2?
- 2 day extension until Tuesday @ 11:59p
- Be wary of using the debugger to find causes of deadlock in multithreaded
- What challenges may arise if trying to reproduce deadlock using a stepwise debugger?

March 4, 2019

School of Engineering and Technology, University of Washington - Tacoma

L13.4

# CHAPTER 15: ADDRESS TRANSLATION

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.5

## OBJECTIVES

- Address translation
- Base and bounds
- HW and OS Support
- Memory segments
- Memory fragmentation

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.6

## ADDRESS TRANSLATION

- 64KB Address space example
- Translation: mapping virtual to physical

The diagram illustrates the mapping of a 64KB virtual address space to physical memory. On the left, the 'Virtual mapping' section shows a 64KB address space divided into four 16KB segments: Program Code (0KB-16KB), Heap (16KB-32KB), heap (free) (32KB-48KB), and Stack (48KB-64KB). Arrows indicate the heap and stack growing towards each other. On the right, the 'Physical Memory' section shows a 64KB layout: Operating System (0KB-16KB), (not in use) (16KB-32KB), Code (32KB-36KB), Heap (36KB-40KB), (allocated but not in use) (40KB-48KB), Stack (48KB-52KB), and (not in use) (52KB-64KB). A bracket on the right side of the physical memory layout is labeled 'Relocated Process'. Dashed lines connect the virtual segments to their physical counterparts: Program Code to Code, Heap to Heap, heap (free) to (allocated but not in use), and Stack to Stack.

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.7

## BASE AND BOUNDS

- Dynamic relocation
- Two registers base & bounds: on the CPU
- OS places program in memory
- Sets base register

$$\text{physical address} = \text{virtual address} + \text{base}$$

- Bounds register
  - Stores size of program address space (16KB)
- OS verifies that every address:

$$0 \leq \text{virtual address} < \text{bounds}$$

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.8

INSTRUCTION EXAMPLE

128 : movl 0x0(%ebx), %eax

- Base = 32768
- Bounds =16384
- Fetch instruction at 128 (virt addr) ↑
  - Phy addr = virt addr + base reg
  - 32896 = 128 + 32768 (base)
- Execute instruction
  - Load from address (var x is @ 15kb=15360)
  - 48128 = 15360 + 32768 (base) -- found x...
- Bounds register: terminate process if
  - **ACCESS VIOLATION:** Virtual address > bounds reg

$physical\ address = virtual\ address + base$

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.9

MEMORY MANAGEMENT UNIT

- MMU
  - Portion of the CPU dedicated to address translation
  - Contains base & bounds registers
- Base & Bounds Example:
  - Consider address translation
  - 4 KB (4096 bytes) address space, loaded at 16 KB physical location

Virtual Address	Physical Address
0	16384
1024	17408
3000	19384
4400	20784 (out of bounds)

FAULT

L13.5

## DYNAMIC RELOCATION OF PROGRAMS

### ■ Hardware requirements:

Requirements	HW support
Privileged mode	CPU modes: kernel, user
Base / bounds registers	Registers to support address translation
Translate virtual addr; check if in bounds	Translation circuitry, check limits
Privileged instruction(s) to update base / bounds regs	Instructions for modifying base/bound registers
Privileged instruction(s) to register exception handlers	Set code pointers to OS code to handle faults
Ability to raise exceptions	For out-of-bounds memory access, or attempts to access privileged instr.

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.11

## OS SUPPORT FOR MEMORY VIRTUALIZATION

### ■ For base and bounds OS support required

- When process starts running
  - Allocate address space in physical memory
- When a process is terminated
  - Reclaiming memory for use
- When context switch occurs
  - Saving and storing the base-bounds pair
- Exception handlers
  - Function pointers set at OS boot time

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.12

OS: WHEN PROCESS STARTS RUNNING

■ OS searches for free space for new process

■ Free list: data structure that tracks available memory slots

The OS lookup the free list

Free list

16KB

48KB

0KB

16KB

32KB

48KB

Physical Memory

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.14

## OS: WHEN CONTEXT SWITCH OCCURS

- OS must save base and bounds registers
  - Saved to the Process Control Block PCB (task\_struct in Linux)

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.15

## DYNAMIC RELOCATION

- OS can move process data when not running
  1. OS deschedules process from scheduler
  2. OS copies address space from current to new location
  3. OS updates PCB (base and bounds registers)
  4. OS reschedules process
- When process runs new base register is restored to CPU
- **Process doesn't know it was even moved!**

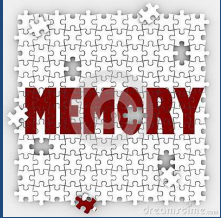

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.16

# CHAPTER 16: SEGMENTATION

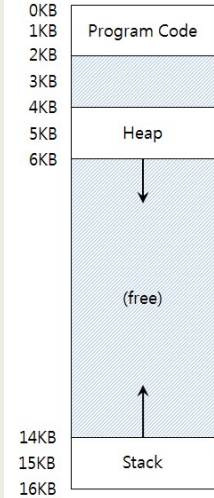

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.17

## BASE AND BOUNDS INEFFICIENCIES

- Address space
  - Contains significant unused memory
  - Is relatively large
  - Preallocates space to handle stack/heap growth
- Large address spaces
  - Hard to fit in memory
- How can these issues be addressed?

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.18

# MULTIPLE SEGMENTS

- Memory segmentation
- Address space has (3) segments
  - Contiguous portions of address space
  - Logically separate segments for: code, stack, heap
- Each segment can placed separately
- Track base and bounds for each segment (registers)

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.19

# SEGMENTS IN MEMORY

- Consider 3 segments:

0KB

16KB

32KB

48KB

64KB

Physical Memory

Operating System

(not in use)

Stack

(not in use)

Code

Heap

(not in use)

Much smaller

Segment	Base	Size
Code	32K	2K
Heap	34K	2K
Stack	28K	2K

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.20

ADDRESS TRANSLATION: CODE SEGMENT

$physical\ address = offset + base$

- Code segment - physically starts at 32KB (base)
- Starts at "0" in virtual address space

Segment	Base	Size
Code		16KB

0KB

100

2KB

4KB

Instructions

Program

Bounds check:  
Is virtual address within 2KB  
address space?

or 32868  
desired  
address

(not in use)

Virtual Address Space

Physical Address Space

March 4, 2019

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.21

ADDRESS TRANSLATION: HEAP

$Virtual\ address + base$  is not the correct physical address.

- Heap starts at virtual address 4096
- The data is at 4200
- Offset= 4200 - 4096 = 104 (virt addr - virt heap start)
- Physical address = 104 + 34816 (offset + heap base)

Segment	Base	Size
Heap	34K	2K

4KB

4200

6KB

data

Heap

Address Space

(not in use)

Code

Heap

(not in use)

Physical Memory

104 + 34K or 34920  
is the desired  
physical address

March 4, 2019

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.22

SEGMENTATION FAULT

- Access beyond the address space
- Heap starts at virtual address: 4096
- Data pointer is to 7KB (7168)
- Is data pointer valid?

- Heap starts at  $4096 + 2 \text{ KB seg size} = 6144$
- Offset=  $7168 > 4096 + 2048 (6144)$

Address Space

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.23

SEGMENT REGISTERS

- Used to dereference memory during translation

Segment      Offset

- First two bits identify segment type
- Remaining bits identify memory offset
- Example: virtual heap address 4200 (01000001101000)

Segment      Offset

Segment	bits
Code	00
Heap	01
Stack	10
-	11

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.24

SEGMENTATION DEREFERENCE

```
1 // get top 2 bits of 14-bit VA
2 Segment = (VirtualAddress & SEG_MASK) >> SEG_SHIFT
3 // now get offset
4 Offset = VirtualAddress & OFFSET_MASK
5 if (Offset >= Bounds[Segment])
6     RaiseException(PROTECTION_FAULT)
7 else
8     PhysAddr = Base[Segment] + Offset
9     Register = AccessMemory(PhysAddr)
```

- VIRTUAL ADDRESS = 01000001101000 (on heap)
- SEG\_MASK = 0x3000 (11000000000000)
- SEG\_SHIFT = 01 → heap (mask gives us segment code)
- OFFSET\_MASK = 0xFFF (00111111111111)
- OFFSET = 000001101000 = 104 (isolates segment offset)
- OFFSET < BOUNDS : 104 < 2048

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.25

STACK SEGMENT

- Stack grows backwards (FILO)
- Requires hardware support:
- Direction bit: tracks direction segment grows

26KB

(not in use)

↑

Stack

28KB

(not in use)

Physical Memory

Segment Register(with Negative-Growth Support)

Segment	Base	Size	Grows	Positive?
Code	32K	2K		1
Heap	34K	2K		1
Stack	28K	2K		0

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.26

## SHARED CODE SEGMENTS

- Code sharing: enabled with HW support
- Supports storing shared libraries in memory only once
- DLL: dynamic linked library
- .so (linux): shared object in Linux (under /usr/lib)
- Many programs can access them
- Protection bits: track permissions to segment

Segment Register Values(with Protection)

Segment	Base	Size	Grows	Positive?	Protection
Code	32K	2K		1	Read-Execute
Heap	34K	2K		1	Read-Write
Stack	28K	2K		0	Read-Write

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.27

## SEGMENTATION GRANULARITY

- Coarse-grained
- Manage memory as large purpose based segments:
  - Code segment
  - Heap segment
  - Stack segment

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.28

SEGMENTATION GRANULARITY - 2

- Fine-grained
- Manage memory as list of segments
- Code, heap, stack segments composed of multiple smaller segments
- Segment table
  - On early systems
  - Stored in memory
  - Tracked large number of segments

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.29

MEMORY FRAGMENTATION

- Consider how much free space?
- We'll say about 24 KB
- Request arrives to allocate a 20 KB heap segment
- Can we fulfil the request for 20 KB of contiguous memory?

	Not compacted
0KB	
8KB	Operating System
16KB	(not in use)
24KB	Allocated
32KB	(not in use)
40KB	Allocated
48KB	(not in use)
56KB	Allocated
64KB	

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.30

# COMPACTION

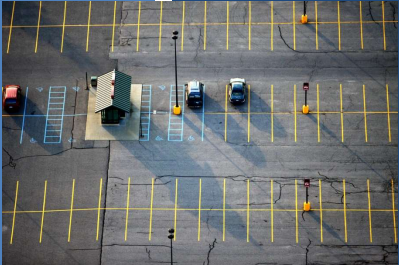

- Supports rearranging memory
- Can we fulfil the request for 20 KB of contiguous memory?
- **Drawback: Compaction is slow**
  - Rearranging memory is time consuming
  - 64KB is fast
  - 4GB+ ... slow
- **Algorithms:**
  - Best fit: keep list of free spaces, allocate the most snug segment for the request
  - Others: worst fit, first fit... (in future chapters)

Compacted	
0KB	Operating System
8KB	
16KB	Allocated
24KB	
32KB	
40KB	
48KB	(not in use)

L13.31

# CHAPTER 17: FREE SPACE MANAGEMENT

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.32

## FREE SPACE MANAGEMENT

- How should free space be managed, when satisfying variable-sized requests?
- What strategies can be used to minimize fragmentation?
- What are the time and space overheads of alternate approaches?

November 20, 2018

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L15.33

## FREE SPACE MANAGEMENT

- Management of memory using
  - Only fixed-sized units
    - Easy: keep a list
    - Memory request → return first free entry
      - Simple search
  - With variable sized units
    - More challenging
    - Results from variable sized malloc requests
    - Leads to fragmentation

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.34

## FRAGMENTATION

- Consider a 30-byte heap

- Request for 15-bytes

- Free space: 20 bytes

- No available contiguous chunk → return NULL

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.35

## FRAGMENTATION - 2

- External: OS can compact

- Example: Client asks for 100 bytes: malloc(100)
- OS: No 100 byte contiguous chunk is available: returns NULL
- Memory is externally fragmented - - Compaction can fix!

- Internal: lost space – OS can't compact

- OS returns memory units that are too large
- Example: Client asks for 100 bytes: malloc(100)
- OS: Returns 125 byte chunk
- Fragmentation is \*in\* the allocated chunk
- Memory is lost, and unaccounted for – can't compact

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.36

## ALLOCATION STRATEGY: SPLITTING

- Request for 1 byte of memory: `malloc(1)`

- OS locates a free chunk to satisfy request
- Splits chunk into two, returns first chunk

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.37

## ALLOCATION STRATEGY: COALESCING

- Consider 30-byte heap
- `Free()` frees all 10 bytes segments (*list of 3-free 10-byte chunks*)

- Request arrives: `malloc(30)`
- SPLIT DOES NOT WORK*** - no contiguous 30-byte chunk exists!
- Coalescing regroups chunks into contiguous chunk

- Allocation can now proceed
- Coalescing is defragmentation of the free space list

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.38

## MEMORY HEADERS

- `free(void *ptr)`: Does not require a size parameter
- *How does the OS know how much memory to free?*
- **Header block**
  - Small descriptive block of memory at start of chunk

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.39

## MEMORY HEADERS - 2

```
typedef struct __header_t {  
    int size;  
    int magic;  
} header_t;
```

A Simple Header

- **Contains size**
- **Pointers:** for faster memory access
- **Magic number:** integrity checking

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.40

## MEMORY HEADERS - 3

- Size of memory chunk is:
  - Header size + user malloc size
  - N bytes + sizeof(header)
- Easy to determine address of header

```
void free(void *ptr) {  
    header_t *hptr = (void *)ptr - sizeof(header_t);  
}
```

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.41

## THE FREE LIST

- Simple free list struct
- Use mmap to create free list
- 4kb heap, 4 byte header, one contiguous free chunk

```
typedef struct __node_t {  
    int size;  
    struct __node_t *next;  
} node_t;
```

```
// mmap() returns a pointer to a chunk of free space  
node_t *head = mmap(NULL, 4096, PROT_READ|PROT_WRITE,  
    MAP_ANON|MAP_PRIVATE, -1, 0);  
head->size = 4096 - sizeof(node_t);  
head->next = NULL;
```

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.42

FREE LIST - 2

■ Create and initialize free-list “heap”

```
// mmap() returns a pointer to a chunk of free space
node_t *head = mmap(NULL, 4096, PROT_READ|PROT_WRITE,
                    MAP_ANON|MAP_PRIVATE, -1, 0);
head->size = 4096 - sizeof(node_t);
head->next = NULL;
```

■ Heap layout:

head →

size: 4088

next: 0

...

[virtual address: 16KB]

header: size field

header: next field(NULL is 0)

the rest of the 4KB chunk

L13.48

## MEMORY ALLOCATION STRATEGIES

### ■ Best fit

- Traverse free list
- Identify all candidate free chunks
- Note which is smallest (has best fit)
- When splitting, “leftover” pieces are small (and potentially less useful -- fragmented)

### ■ Worst fit

- Traverse free list
- Identify largest free chunk
- Split largest free chunk, leaving a still large free chunk

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.49

## EXAMPLES

### ■ Allocation request for 15 bytes

### ■ Result of Best Fit

### ■ Result of Worst Fit

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.50

## MEMORY ALLOCATION STRATEGIES - 2

- **First fit**
  - Start search at beginning of free list
  - Find first chunk large enough for request
  - Split chunk, returning a “fit” chunk, saving the remainder
  - Avoids full free list traversal of best and worst fit
- **Next fit**
  - Similar to first fit, but start search at last search location
  - Maintain a pointer that “cycles” through the list
  - Helps balance chunk distribution vs. first fit
  - Find first chunk, that is large enough for the request, and split
  - Avoids full free list traversal

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.51

## SEGREGATED LISTS

- For popular sized requests  
e.g. for kernel objects such as locks, inodes, etc.
- Manage as segregated free lists
- Provide object caches: stores pre-initialized objects
- How much memory should be dedicated for specialized requests (object caches)?
- If a given cache is low in memory, can request “*slabs*” of memory from the general allocator for caches.
- General allocator will reclaim slabs when not used

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.52

## BUDDY ALLOCATION

- Binary buddy allocation
  - Divides free space by two to find a block that is big enough to accommodate the request; the next split is too small...
- Consider a 7KB request

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.53

## BUDDY ALLOCATION - 2

- Buddy allocation: suffers from internal fragmentation
- Allocated fragments, typically too large
- Coalescing is simple
  - Two adjacent blocks are promoted up

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.54

# CHAPTER 18: INTRODUCTION TO PAGING

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.55

## PAGING

- Split up address space of process into fixed sized pieces called **pages**
- Alternative to variable sized pieces (Segmentation) which suffers from significant fragmentation
- Physical memory is split up into an array of fixed-size slots called **page frames**.
- Each process has a **page table** which translates virtual addresses to physical addresses

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.56

ADVANTAGES OF PAGING

■ Flexibility

■ Abstracts the process address space into pages

■ No need to track direction of HEAP / STACK growth

- Just add more pages...

■ No need to store unused space

- As with segments...

■ Simplicity

■ Pages and page frames are the same size

■ Easy to allocate and keep a free list of pages

March 4, 2019

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.57

PAGING: EXAMPLE

School of Engineering and Technology, University of Washington - Tacoma

L13.58

PAGING: ADDRESS TRANSLATION

- PAGE: Has two address components
  - VPN: Virtual Page Number
  - Offset: Offset within a Page

VPN		offset			
Va5	Va4	Va3	Va2	Va1	Va0

- Example:  
Page Size: 16-bytes, Address Space: 64-bytes

VPN		offset			
0	1	0	1	0	1

Here there are just four pages...

March 4, 2019

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.59

EXAMPLE:  
PAGING ADDRESS TRANSLATION

- Consider a 64-byte program address space (4 pages)
- Stored in 128-byte physical memory (8 frames)

- Offset is preserved
- VPN is looked up

Page Table:  
VP0 → PF3  
VP1 → PF7  
VP2 → PF5  
VP3 → PF2

VPN		offset						
Virtual Address		0	1	0	1	0	1	
		↓	↓	↓	↓	↓	↓	
		Address Translation						
		↓	↓	↓	↓	↓	↓	
Physical Address		1	1	1	0	1	0	1
		PFN			offset

L13.60

## PAGING DESIGN QUESTIONS

- (1) Where are page tables stored?
- (2) What are the typical contents of the page table?
- (3) How big are page tables?
- (4) Does paging make the system too slow?

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.61

## (1) WHERE ARE PAGE TABLES STORED?

- Example:
  - Consider a 32-bit process address space (up to 4GB)
  - With 4 KB pages
  - 20 bits for VPN ( $2^{20}$  pages)
  - 12 bits for the page offset ( $2^{12}$  unique bytes in a page)
- Page tables for each process are stored in RAM
  - Support potential storage of  $2^{20}$  translations  
= 1,048,576 pages per process
  - Each page has a page table entry size of 4 bytes

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.62

## PAGE TABLE EXAMPLE

- With  $2^{20}$  slots in our page table for a single process
- Each slot dereferences a VPN
- Provides physical frame number
- Each slot requires 4 bytes (32 bits)
  - 20 for the PFN on a 4GB system with 4KB pages
  - 12 for the offset which is preserved
  - (note we have no status bits, so this is unrealistically small)
- How much memory to store page table for 1 process?
  - 4,194,304 bytes (or 4MB) to index one process

VPN <sub>0</sub>
VPN <sub>1</sub>
VPN <sub>2</sub>
...
...
VPN <sub>1048576</sub>

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.63

## NOW FOR AN ENTIRE OS

- If 4 MB is required to store one process
  - Consider how much memory is required for an entire OS?
    - With for example 100 processes...
  - Page table memory requirement is now 4MB x 100 = 400MB
  - If computer has 4GB memory (maximum for 32-bits), the page table consumes 10% of memory
- 400 MB / 4000 GB
- Is this efficient?

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.64

(2) WHAT'S ACTUALLY IN THE PAGE TABLE

- Page table is data structure used to map virtual page numbers (VPN) to the physical address (Physical Frame Number PFN)
  - Linear page table → simple array
- Page-table entry
  - 32 bits for capturing state

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An x86 Page Table Entry(PTE)

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.66

## PAGE TABLE ENTRY - 2

- Common flags:
- **Valid Bit**: Indicating whether the particular translation is valid.
- **Protection Bit**: Indicating whether the page could be read from, written to, or executed from
- **Present Bit**: Indicating whether this page is in physical memory or on disk(swapped out)
- **Dirty Bit**: Indicating whether the page has been modified since it was brought into memory
- **Reference Bit(Accessed Bit)**: Indicating that a page has been accessed

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.67

## (3) HOW BIG ARE PAGE TABLES?

- Page tables are too big to store on the CPU
- Page tables are stored using physical memory
- Paging supports efficiently storing a sparsely populated address space
  - Reduced memory requirement  
Compared to base and bounds, and segments

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.68

## (4) DOES PAGING MAKE THE SYSTEM TOO SLOW?

### ■ Translation

#### ■ Issue #1: Starting location of the page table is needed

- HW Support: Page-table base register
  - stores active process
  - Facilitates translation

Stored in RAM →

#### **Page Table:**

VP0 → PF3  
VP1 → PF7  
VP2 → PF5  
VP3 → PF2

#### ■ Issue #2: Each memory address translation for paging requires an extra memory reference

- HW Support: TLBs (Chapter 19)

March 4, 2019

TCCS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.69

## PAGING MEMORY ACCESS

```
1. // Extract the VPN from the virtual address
2. VPN = (VirtualAddress & VPN_MASK) >> SHIFT
3.
4. // Form the address of the page-table entry (PTE)
5. PTEAddr = PTBR + (VPN * sizeof(PTE))
6.
7. // Fetch the PTE
8. PTE = AccessMemory(PTEAddr)
9.
10. // Check if process can access the page
11. if (PTE.Valid == False)
12.     RaiseException(SEGMENTATION_FAULT)
13. else if (CanAccess(PTE.ProtectBits) == False)
14.     RaiseException(PROTECTION_FAULT)
15. else
16.     // Access is OK: form physical address and fetch it
17.     offset = VirtualAddress & OFFSET_MASK
18.     PhysAddr = (PTE.PFN << PFN_SHIFT) | offset
19.     Register = AccessMemory(PhysAddr)
```

March 4, 2019

School of Engineering and Technology, University of Washington - Tacoma

L13.70

COUNTING MEMORY ACCESSES

■ Example: Use this Array initialization Code

```
int array[1000];  
...  
for (i = 0; i < 1000; i++)  
    array[i] = 0;
```

■ Assembly equivalent:

```
0x1024 movl $0x0, (%edi,%eax,4)  
0x1028 incl %eax  
0x102c cmpl $0x03e8,%eax  
0x1030 jne 0x1024
```

L13.72

PAGING SYSTEM EXAMPLE

- Consider a 4GB Computer:
- With a 4096-byte page size (4KB)
- How many pages would fit in physical memory?

  

- Now consider a page table:
- For the page table entry, how many bits are required for the VPN?
- If we assume the use of 4-byte (32 bit) page table entries, how many bits are available for status bits?
- How much space does this page table require?  
Page Table Entries x Number of pages
- How many page tables (for user processes) would fill the entire 4GB of memory?

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.75

## TRANSLATION LOOKASIDE BUFFER

- Legacy name...
- Better name, “Address Translation Cache”
- TLB is an on CPU cache of address translations
  - virtual → physical memory

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.76

TRANSLATION LOOKASIDE BUFFER - 2

■ Goal:  
Reduce access  
to the page  
tables

■ Example:  
50 RAM accesses  
for first 5 for-loop  
iterations

■ Move lookups  
from RAM to TLB  
by caching page  
table entries

Page Table[39]

## TRANSLATION LOOKASIDE BUFFER (TLB)

- Part of the CPU's Memory Management Unit (MMU)
- Address translation cache

The TLB is an address translation cache  
Different than L1, L2, L3 CPU memory caches

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.79

## TLB BASIC ALGORITHM

- For: array based page table
- Hardware managed TLB

```
1: VPN = (VirtualAddress & VPN_MASK) >> SHIFT
2: (Success, TlbEntry) = TLB_Lookup(VPN)
3: if (Success == True) { // TLB Hit
4:   if (CanAccess(TlbEntry.ProtectBits) == True) {
5:     Offset = VirtualAddress & OFFSET_MASK
6:     PhysAddr = (TlbEntry.PFN << SHIFT) | Offset
7:     AccessMemory(PhysAddr)
8:   } else RaiseException(PROTECTION_ERROR)
```

Generate the physical address to access memory

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.80

## TLB BASIC ALGORITHM - 2

```
11:     else{ //TLB Miss
12:         PTEAddr = PTBR + (VPN * sizeof(PTE))
13:         ➡ PTE = AccessMemory(PTEAddr)
14:         (...) // Check for, and raise exceptions...
15:
16:         ➡ TLB_Insert( VPN , PTE.PFN , PTE.ProtectBits)
17:         ➡ RetryInstruction()
18:     }
19: }
```

Retry the instruction... (requery the TLB)

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.81

## TLB – ADDRESS TRANSLATION CACHE

- Key detail:
- For a TLB miss, we first access the page table in RAM to populate the TLB... we then requery the TLB
- All address translations go through the TLB

March 4, 2019

TCSS422: Operating Systems [Winter 2019]  
School of Engineering and Technology, University of Washington - Tacoma

L13.82

TLB EXAMPLE

```
0:      int sum = 0 ;
1:      for( i=0; i<10; i++){
2:          sum+=a[i];
3:      }
```

- Example:
- Program address space: 256-byte
  - Addressable using 8 total bits ( $2^8$ )
  - 4 bits for the VPN (16 total pages)
- Page size: 16 bytes
  - Offset is addressable using 4-bits
- Store an array: of (10) 4-byte integers

	OFFSET				
	00	04	08	12	16
VPN = 00					
VPN = 01
