SURVEY QUESTIONS

Survey has two questions:

Be sure to add your questions about the previous class to the **second question**

1<sup>st</sup> question: After today's class, comment on any new concepts that you learned about?  

Have been getting questions here...

2<sup>nd</sup> question: After today's class, what point(s) remain least clear to you?  

>> Please add questions HERE

TCSS 558 - Online Daily Feedback Survey - 1/5

Due Jan 6 at 10pm

Points 1

Questions 4

Available Jan 5 at 1:30pm - Jan 6 at 11:59pm 1 day

Time Limit None

Question 1

0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

1

2

3

4

5

6

7

8

9

10

Mostly Review To Me

Equal New and Review

Mostly New To Me

Question 2

0.5 pts

Please rate the pace of today's class:

1

2

3

4

5

6

7

8

9

10

Slow

Just Right

Fast

February 6, 2024

School of Engineering and Technology, University of Washington - Tacoma

L10.5

5

MATERIAL / PACE

Please classify your perspective on material covered in today's class (24 respondents):

1-mostly review, 5-equal new/review, 10-mostly new

Average – 6.04 (↓ - previous 6.60)

Please rate the pace of today's class:

1-slow, 5-just right, 10-fast

Average – 5.52 (↑ - previous 5.80)

Slides by Wes J. Lloyd

L10.1

FEEDBACK FROM 2/1

- Consider a stateless server that doesn't maintain a soft state. In this scenario, what is the use of maintaining cache in stateless server? Is it even applicable? Can you please provide an example?
  - An application data cache may not be used to store session state data since it is transient – but cached data can help a server in many ways
  - A server can cache results of common operations and database queries for immediate recall to improve performance for common / repeated requests.
  - Database servers automatically cache recent query results. For example: 'select count(\*) from table;'
  - Frequently use memory pages from shared libraries and application program code can be cached in Level 1, Level 2, and Level 3 CPU caches to speed-up program performance of the server
  - Linux uses a virtual memory subsystem, and caching memory page translations for commonly accessed virtual to physical page address translations can increase performance of the server

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.7

7

FEEDBACK - 2

- Can you please provide an example of a well known application that uses object based servers?
- "Distributed objects were popular in the late 1990s and early 2000s, but have since fallen out of favor.", from: <https://martinfowler.com/articles/distributed-objects-microservices.html>
- Visualforce Remote Objects provide client proxy objects (in a web browser) for basic data manipulation operations on sObjects hosted on a remote server.
- Every Salesforce sObject corresponds to a database table where it is stored

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.8

8

FEEDBACK - 3

- Consider a scenario where two people using the same debit card have made an online purchase at the same time to the extent of a millisecond. The total amount available is 30\$. Person A makes a purchase of 30\$ and Person B makes a purchase of 25\$. In this scenario we may look at payment server as handling multiple concurrent requests. Can you please provide your inputs on how an effective payment server should handle this scenario?
- We will discuss a solution to this sort of problem known as total-ordered multicasting using logical clocks in Chapter 6

AWS CLOUD CREDITS UPDATE

- We have received AWS CLOUD CREDITS for TCSS 558 – W2024
- Credits will be provided by email request
  - Please include: 12-digit AWS account ID, and AWS account email
- Credits will first be provided for students not in F23 TCSS562
- Request codes by sending an email with the subject: "AWS CREDIT REQUEST" to [wiloyd@uw.edu](mailto:wiloyd@uw.edu)
- Codes can also be obtained in person (or zoom), in the class, during the breaks, after class, during office hours, by appt
- Credit codes are carefully exchanged, and not shared by IM
- For students unable to create a standard AWS account: Please contact instructor by email - Instructor will work to create hosted IAM user account

ASSIGNMENT 1

- Preparing for Assignment 1: Intro to Cloud Computing Infrastructure and Load Balancing
  - Establish AWS Account - Standard account
- Now posted:
  - Task 0 - Establish local Linux/Ubuntu environment
  - Task 1 - AWS account setup, obtain user credentials
  - Task 2 - Intro to: Amazon EC2 & Docker: create Dockerfile for Apache Tomcat
  - Task 3 - Create Dockerfile for haproxy (software load balancer)
  - Task 4 - Working with Docker-Machine
  - Task 5 - Submit Results of testing alternate server configs

L10.12

12

TESTING CONNECTIVITY TO SERVER (PG 16-18)

- `testFibPar.sh` script is a parallel test script
- Orchestrates multiple threads on client to invoke server multiple times in parallel
- To simplify coordination of parallel service calls in BASH, `testFibPar.sh` script ignores errors !!!
- To help test client-to-server connectivity, there is also a `testFibService.sh` script that supports 3 tests
- TEST 1: **Network layer** test
  - Ping (ICMP)
- TEST 2: **Transport layer** test
  - TCP: telnet (TCP Port 8080) – security group (fw) test
- TEST 3: **Application layer** test
  - HTTP REST – web service test

L10.14

14

ASSIGNMENT 2

- **Multi-protocol TCP/UDP/RMI Key Value Store**
- Implement a “GenericNode” where the application can be launched to assume the role of a client or server for a Key/Value Store data store
- Recommended in Java (11)
- Client node program interacts with server node to put, get, delete, or list items in a key/value store
- Multi-threaded or single-threaded server

CH. 3.4: SERVERS

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.18

18

TYPES OF SERVERS

- **Daemon server**
  - Example: NTP server
- **Superserver**
- **Stateless server**
  - Example: Apache server
- **Stateful server**
- **Object servers**
- **EJB servers**

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.19

19

OBJECT SERVERS

- **OBJECTIVE:** Host objects and enable remote client access
- Do not provide a specific service
  - Do nothing if there are no objects to host
- Support adding/removing hosted objects
- Provide a home where objects live
- Objects, *themselves*, provide “services”
- Object parts
  - State data
  - Code (methods, etc.)
- **Transient object(s)**
  - Objects with limited lifetime (< server)
  - Created at first invocation, destroyed when no longer used (i.e. no clients remain “bound”).
  - Disadvantage: initialization may be expensive
  - Alternative: preinitialize and retain objects on server start-up

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.20

20

OBJECT SERVERS - 2

- **Should object servers isolate memory for object instances?**
  - Share neither code nor data
  - May be necessary if objects couple data and implementation
- Object server threading designs:
  - Single thread of control for object server
  - One thread for each object
  - Servers use separate thread for client requests
- Threads created on demand    **vs.**    Server maintains pool of threads
- **What are the tradeoffs for creating server threads on demand vs. using a thread pool?**

L10.21

21

EJB – ENTERPRISE JAVA BEANS

- EJB- specialized Java object hosted by a EJB web container
- **4 types:** Session (**stateless**, **stateful**), **entity**, and **message-driven beans**
- Provides “middleware” standard (framework) for implementing back-ends of enterprise applications
- EJB web application containers integrate support for:
  - Transaction processing
  - Persistence
  - Concurrency
  - Event-driven programming
  - Asynchronous method invocation
  - Job scheduling
  - Naming and discovery services (JNDI)
  - Interprocess communication
  - Security
  - Software component deployment to an application server

School of Engineering and Technology, University of Washington - Tacoma

L10.22

22

APACHE WEB SERVER

- Highly configurable, extensible, platform independent
- Supports TCP HTTP protocol communication
- Uses hooks – placeholders for group of functions
- Requests processed in phases by hooks
- Many hooks:
  - Translate a URL
  - Write info to log
  - Check client ID
  - Check access rights
- Hooks processed in order enforcing flow-of-control
- Functions in replaceable modules

The diagram illustrates the Apache Web Server architecture. It shows a central 'Apache core' box. Above it, there are several 'Module' boxes. Arrows labeled 'hook' point from the modules to the core. A 'Function' box is also shown, with an arrow pointing to the core. A 'Link between function and hook' is indicated. Below the core, a 'Request' enters and a 'Response' exits. A note says 'Hooks point to functions in modules' and 'Functions called per hook'.

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.23

23

SERVER CLUSTERS

- Hosted across an LAN or WAN
- Collection of interconnected machines
- Can be organized in tiers:
  - Web server → app server → DB server
  - App and DB server sometimes integrated

The diagram shows a three-tier architecture. On the left, 'Client requests' enter a 'First tier' box. This box contains a 'Logical switch (possibly multiple)' and 'Application/compute servers'. An arrow labeled 'Dispatched request' points from the first tier to a 'Second tier' box, which contains 'Application/compute servers'. An arrow points from the second tier to a 'Third tier' box, which contains a 'Distributed file/database system'.

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.24

24

LAN REQUEST DISPATCHING

- Front end of three tier architecture (logical switch) provides distribution transparency – hides multiple servers
- Transport-layer switches: switch accepts TCP connection requests, hands off to a server
  - Example: hardware load balancer (F5 networks – Seattle)
  - HW Load balancer - OSI layers 4-7
- Network-address-translation (NAT) approach:
  - All requests pass through switch
  - Switch sits in the middle of the client/server TCP connection
  - Maps (rewrites) source and destination addresses
- Connection hand-off approach:
  - TCP Handoff:** switch hands of connection to a selected server

February 6, 2024

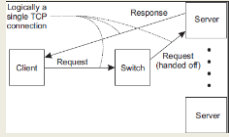

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.25

25

LAN REQUEST DISPATCHING - 2

- Who is the best server to handle the request?
- Switch plays important role in distributing requests
- Implements load balancing
- Round-robin** – routes client requests to servers in a looping fashion
- Transport-level** – route client requests based on TCP port number
- Content-aware request distribution** – route requests based on inspecting data payload and determining which server node should process the request

February 6, 2024

School of Engineering and Technology, University of Washington - Tacoma

L10.26

26

WIDE AREA CLUSTERS

- Deployed across the internet
- Leverage resource/infrastructure from Internet Service Providers (ISPs)
- Cloud computing simplifies building WAN clusters
- Resource from a single cloud provider can be combined to form a cluster
- For deploying a cloud-based cluster (WAN), what are the implications of deploying nodes to:**
  - (1) a single availability zone (e.g. us-east-1e)?
  - (2) across multiple availability zones?

February 6, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L10.27

27

WAN REQUEST DISPATCHING

- Goal: minimize network latency using WANs (e.g. Internet)
- Send requests to nearby servers
- Request dispatcher: routes requests to nearby server
- Example:** Domain Name System
  - Hierarchical decentralized naming system
- Linux: find your DNS servers:

```
# Find you device name of interest
nmcli dev
# Show device configuration
nmcli device show <device name>
```

School of Engineering and Technology, University of Washington - Tacoma

L10.28

28

DNS LOOKUP

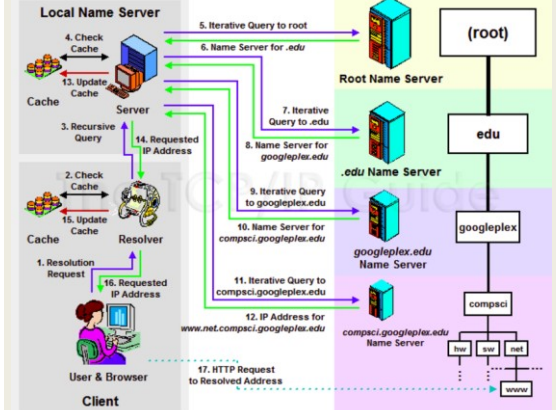

- First query local server(s) for address
- Typically there are (2) local DNS servers
  - One is backup
- Hostname may be cached at local DNS server
  - E.g. [www.google.com](http://www.google.com)
- If not found, local DNS server routes to other servers
- Routing based on components of the hostname
- DNS servers down the chain mask the client IP, and use the originating DNS server IP to identify a local host
- Weakness:** client may be far from DNS server used. Resolved hostname is close to DNS server, but not necessarily close to the client

February 6, 2024

School of Engineering and Technology, University of Washington - Tacoma

L10.29

29

30

DNS: LINUX COMMANDS

- `nslookup <ip addr / hostname>`
- Name server lookup – translates hostname or IP to the inverse
- `traceroute <ip addr / hostname>`
- Traces network path to destination
- By default, output is limited to 30 hops, can be increased

School of Engineering and Technology, University of Washington - Tacoma

L10.31

31

DNS EXAMPLE – WAN DISPATCHING

- Ping [www.google.com](http://www.google.com) in WA from wireless network:
  - nslookup: 6 alternate addresses returned, choose (74.125.28.147)
  - Ping 74.125.28.147: Average RTT = **22.458 ms (11 attempts, 22 hops)**
- Ping [www.google.com](http://www.google.com) in VA (us-east-1) from EC2 instance:
  - nslookup: 1 address returned, choose 172.217.9.196
  - Ping 172.217.9.196: Average RTT = 1.278 ms (11 attempts, 13 hops)
- From VA EC2 instance, ping WA [www.google](http://www.google.com) server
  - Ping 74.125.28.147: Average RTT 62.349ms (11 attempts, 27 hops)
  - Pinging the WA-local server is ~60x slower from VA
- From local wireless network, ping VA us-east-1 google :
  - Ping 172.217.9.196: Average RTT=81.637ms (11 attempts, 15 hops)

L10.32

32

DNS EXAMPLE – WAN DISPATCHING

- Ping [www.google.com](http://www.google.com) in WA from wireless network:
  - nslookup: 6 alternate addresses returned, choose (74.125.28.147)

Latency to ping VA server in WA: ~3.63x

WA client: local-google 22.458ms to VA-google 81.637ms

Latency to ping WA server in VA: ~48.7x

VA client: local-google 1.278ms to WA-google 62.349!

- From local wireless network, ping VA us-east-1 google :
- Ping 172.217.9.196: Average RTT=81.637ms (11 attempts, 15 hops)

35

PRACTICE MIDTERM

- Envisioned as a class activity
- Form groups of 1-3 in class or via Zoom breakout rooms
- Each group works on 2 assigned questions
- Group submits PDF solution by end of day today
- Instructor shares solutions provided from the class submission via Canvas by Wednesday morning
  - Subject to updates for late submissions
- Outcome:  
All students have access to solutions for review and practice
- Class Activity:  
<https://canvas.uw.edu/files/115846587/>
