APPLIED DISTRIBUTED COMPUTING

Types of Distributed Systems

Wes J. Lloyd  
School of Engineering & Technology (SET)  
University of Washington - Tacoma

1

OBJECTIVES - 1/11

Questions from 1/9

Activity: Design goals of distributed systems

Chapter 1.3 - Types of distributed systems

- HPC, Cluster, Grid, Cloud
- Distributed information systems
  - Transactions
  - Application Integration: Shared files, DBs, RPC, RMI, Message-oriented middleware
- Pervasive Systems
  - Ubiquitous computing systems
  - Mobile systems
  - Sensor networks

TCSS 558 OFFICE HOURS - WINTER 2024

26 of 32 survey responses so far - top 3 votes

- #1: Tuesday afternoon before class (66.7%)
- #2: Thursday afternoon before class (58.3%)
- #3: Prefer office hours online via Zoom (41.7%)

Of note: Prefer office hours in-person (20.8%)

Office hour - Tuesdays before class

- ~2:30 - 3:30p CP 229 and Zoom

Additional hours will be added as needed

- In particular, we will try to add extra hours on Thursdays before class, or on Fridays via Zoom at peak times

Also by email appointment: [wloyd@uw.edu](mailto:wloyd@uw.edu)

TCSS 558 - Online Daily Feedback Survey - 1/5

Due Jan 6 at 10pm

Points 1

Questions 4

Available Jan 5 at 1:30pm - Jan 6 at 11:59pm 1 day

Time Limit None

Question 1

0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

1 2 3 4 5 6 7 8 9 10

Mostly Review To Me Equal New and Review Mostly New To Me

Question 2

0.5 pts

Please rate the pace of today's class:

1 2 3 4 5 6 7 8 9 10

Slow Just Right Fast

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.5

5

MATERIAL / PACE

Please classify your perspective on material covered in today's class (33 respondents):

1-mostly review, 5-equal new/review, 10-mostly new

Average - 6.60 (↓ - previous 6.85)

Please rate the pace of today's class:

1-slow, 5-just right, 10-fast

Average - 5.16 (↓ - previous 5.50)

FEEDBACK FROM 1/9

- I plan to read the chapter before the next class and hope that between the textbook and the lectures, things will start to make more sense.
  - Great !
  - The focus is on Chapter 1 from the 3<sup>rd</sup> edition
- Load balancer / load balancing
  - Network traffic (client requests) are distributed across multiple servers to enable the application to scale **horizontally**
  - Improve application responsiveness, availability

January 11, 2024

L3.7

7

LOAD BALANCING

Without Load Balancing

Does this system provide "location" transparency ?

Server 1 (overloaded)

Server 3

Server 4

Image credit: <https://www.cloudflare.com/learning/performance/what-is-load-balancing/>

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.8

8

LOAD BALANCING - 2

- How do Load Balancers distribute user requests to nodes of a distributed system?
- Client request to the host routes to the load balancer
- Load balancer decides where to send the client's request based on capacity (how busy?), or location of user's data

Clients

Internet

Load Balancer

Servers

EDGE / FOG / CLOUD

In distributed systems nodes can be anywhere at the edge, in the fog, or in the cloud...

Cloud: remote servers

Fog: local servers

Edge: clients and/or mini-servers (Internet of things - IOT)

CLOUD COMPUTING VS. FOG COMPUTING VS. EDGE COMPUTING

Cloud: Thousands of Data Centers

Fog: Millions of Nodes

Edge: Billions of Devices

17

CLASS ACTIVITY 1

We will form groups of ~2-3

- Remote students will use Canvas breakout rooms

Each group will complete a MS Word Doc worksheet

Add names to top of worksheet as they appear in Canvas

Once completed, **one person** submits a PDF of the Word Doc to Canvas

Grader will score all group members based on the uploaded PDF file

To get started:

- Log into Canvas, TCSS 558 A
- Find worksheet under Class Activity 1

TECHNOLOGY INNOVATIONS  
LEADING TO CLOUD COMPUTING

- Super computers**
  - Huge multiprocessor systems with shared memory/RAM
  - Technically "not distributed"
  - Hardware all in one location
  - Initially expensive with proprietary designs
  - Traditionally supported HPC - High Performance Computing scientific applications
    - Weather forecasting
    - Molecular dynamics simulation
    - Protein modeling
  - Cost millions of dollars
  - Large systems consume MWs of electricity

January 11, 2024

TCSS 558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.22

22

INNOVATIONS LEADING  
TO CLOUD COMPUTING - 2

- Cluster computing**
  - Group of interconnected homogeneous servers
  - Design emphasizes redundancy as server components are easily interchanged to keep overall system running
- Grid computing**
  - Distributed heterogeneous servers organized into logical pools of loosely coupled resources connected by the internet
  - geographically dispersed
  - middleware software supports workload distribution and coordination functions
- Virtualization**
- Others**

School of Engineering and Technology, University of Washington - Tacoma

L3.24

24

PUBLIC CLOUD COMPUTING

- Offers computing, storage, communication at \$ per hour
- No premium to scale:

1000 computers

@ 1 hour

=

1 computer

@ 1000 hours
- Illusion of infinite scalability to cloud user
- As many computers as you can afford
- Leading examples:  
Amazon Web Services, Google App Engine, Microsoft Azure
- Amazon runs its own e-commerce on AWS!
- Billing models are becoming increasingly granular
  - By the hour, minute, second, now millisecond
  - Example: AWS Lambda \$0.0000002 per request (call)  
\$0.000000021 to rent 128MB / 1-ms

January 11, 2024

TCSS 558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.25

25

PUBLIC CLOUD COMPUTING - 2

- IaaS vs FaaS 1-month cost comparison - 30.4167 days/month

**c4.large ec2 virtual machine (Infrastructure-as-a-Service - IaaS):**  
2 vCPU cores, 3.75 GB RAM, Intel Xeon E5-2666 v3  
10¢ an hour, 24 hrs/day, billed by the second (60 sec min)  
Cost → \$73.00/month on-demand EC2 instance

**AWS Lambda (Function-as-a-Service - FaaS serverless):**  
2 vCPU cores, 3GB RAM, Intel Xeon E5-2666 v3 (maybe?)  
as 2,628,000 x 1-sec service calls  
\$0.00001667 GB/sec, billed by the millisecond (no min)  
**What is the cost ???**  
**\$131.43 (1.8x)**

School of Engineering and Technology, University of Washington - Tacoma

L3.26

26

PAAS SERVICES IMPLEMENTATION

- PaaS services often built atop of IaaS
  - Amazon RDS, Heroku, Amazon ElastiCache
- Scalability
  - VM resources can support fluctuations in demand
- Dependability.
  - PaaS services built on highly available IaaS resources

January 11, 2024

28

DISTRIBUTED INFORMATION SYSTEMS

- Enterprise-wide** integrated applications (example: UW Workday)
  - Organizations confronted with too many applications
  - Interoperability among applications was difficult
  - Led to many middleware-based solutions
- Key concepts
  - Component based architectures** - database components, processing components
  - Distributed transaction** - Client wraps requests together, sends as single aggregated request
  - Atomic: all or none** of the individual requests should be executed
- Different systems define different **action** primitives
  - Components of the atomic transaction
  - Examples: send, receive, forward, READ, WRITE, etc.

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.29

29

DISTRIBUTED INFORMATION SYSTEMS - 2

- Transaction primitives

Primitive	Description
BEGIN_TRANSACTION	Mark the start of a transaction
END_TRANSACTION	Terminate the transaction and try to commit
ABORT_TRANSACTION	Kill the transaction and restore the old values
READ	Read data from a file, a table, or otherwise
WRITE	Write data to a file, a table, or otherwise
- Transactions are all-or-nothing
  - All operations are executed
  - None are executed

## OBJECTIVES - 1/11

- Questions from 1/9
- Activity: Design goals of distributed systems
- Chapter 1.3 - Types of distributed systems
  - HPC, Cluster, Grid, Cloud
  - Distributed information systems
    - Transactions**
      - Application Integration: Shared files, DBs, RPC, RMI, Message-oriented middleware
  - Pervasive Systems
    - Ubiquitous computing systems
    - Mobile systems
    - Sensor networks

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.31

31

## TRANSACTIONS: ACID PROPERTIES

- Atomic**: The transaction occurs indivisibly
- Consistent**: Transaction does not create variant states across nodes during slow updates (e.g. system variants)
  - Replicas remain constant until all updated
  - Two phase commit: data pushed first, then the commit
- Isolated**: Transactions do not interfere with each other
- Durable**: Once a transaction commits, change are permanent
- Nested transaction**: transaction constructed with many sub-transactions
  - Follows a logical division of work
  - Must support "rollback" of sub-transactions

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.32

32

## TRANSACTION PROCESSING MONITOR

- Allow an application to access multiple DBs via a transactional programming model
- TP monitor**: coordinates commitment of sub-transactions using a distributed commit protocol (Ch. 8)
  - Saves application complexity from having to coordinate distributed transactions

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.33

33

## OBJECTIVES - 1/11

- Questions from 1/9
- Activity: Design goals of distributed systems
- Chapter 1.3 - Types of distributed systems
  - HPC, Cluster, Grid, Cloud
  - Distributed information systems
    - Transactions
      - Application Integration: Shared files, DBs, RPC, RMI, Message-oriented middleware**
  - Pervasive Systems
    - Ubiquitous computing systems
    - Mobile systems
    - Sensor networks

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.34

34

## ENTERPRISE APPLICATION INTEGRATION

- Dist. Info systems support application components direct communication with each other, not via databases
- Communication mechanisms**:
  - Remote procedure call (RPC)**
    - Local procedure call packaged as a message and sent to server
    - Supports distribution of function call processing
  - Remote method Invocations (RMI)**
    - Operates on objects instead of functions
- RPC and RMI - led to tight coupling
- Client and server endpoints must be up and running
- Interfaces coupled to specific languages and not *Interoperable*
- This led to evolution of: **Message-oriented middleware (MOM)**

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.35

35

## MESSAGE-ORIENTED MIDDLEWARE

- Publish and subscribe systems**:
  - Rabbit MQ, Apache Kafka, AWS SQS
- Reduces tight coupling of RPC/RMI**
- Applications indicate interest for specific type(s) of messages by sending requests to logical contact points**
- Communication middleware delivers messages to subscribing applications**

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.36

36

CHALLENGES WITH VARIOUS APPLICATION INTEGRATION METHODS

- Integration via shared data files and transfers
  - Shared data files (e.g. XML)
  - Leads to file management challenges (concurrent updates, etc.)
- Shared database
  - Centralized DB, transactions to coordinate changes among users
  - Common data schema required – can be challenging to derive
  - For many reads and updates, shared DB becomes bottleneck (*limited scalability*)
- Remote procedure call – app A executes on and against app B data. App A lacks direct access to app B data.
- Messaging middleware - ensures nodes temporarily offline later on, can receive messages

January 11, 2024

PERVASIVE SYSTEMS

- Existing everywhere, widely adopted...
- Combine current network technologies, wireless computing, voice recognition, internet capabilities and AI to create an environment where connectivity of devices is embedded, unobtrusive, and always available
- Many sensors infer various aspects of a user's behavior
  - Myriad of actuators to collect information, provide feedback
- TYPES OF PERVASIVE SYSTEMS:
  - Ubiquitous computing systems
  - Mobile systems
  - Sensor networks

L3.40

40

PERVASIVE SYSTEM TYPE: UBIQUITOUS COMPUTING SYSTEMS

- Pervasive and continuously present
- Goal: embed processors everywhere (day-to-day objects) enabling them to communicate information
- Requirements for a ubiquitous computing system:
  - Distribution – devices are networked, distributed, and accessible transparently
  - Interaction – unobtrusive (low-key) between users and devices
  - Context awareness – optimizes interaction
  - Autonomy – devices operate autonomously, self-managed
  - Intelligence – system can handle wide range of dynamic actions and interactions

January 11, 2024

School of Engineering and Technology, University of Washington - Tacoma

L3.41

41

UBIQUITOUS COMPUTING DEVICES EXAMPLES

- Apple Watch
- Amazon Echo Speaker
- Amazon EchoDot (single speaker design)
- Fitbit
- Electronic Toll Systems
- Smart Traffic Lights
- Self Driving Cars
- Home Automation

School of Engineering and Technology, University of Washington - Tacoma

L3.42

42

UBIQUITOUS COMPUTING  
SYSTEM EXAMPLE

- Domestic ubiquitous computing environment example:
- Interconnect lighting and environmental controls with personal biometric monitors woven into clothing so that illumination and heating conditions in a room might be modulated, continuously and imperceptibly
- IoT technology helps enable ubiquitous computing

L3.44

44

PERVASIVE SYSTEM TYPE:  
MOBILE SYSTEMS

- Emphasis on mobile devices, e.g. smartphones, tablet computers
- New devices: remote controls, pagers, active badges, car equipment, various GPS-enabled devices,
- Devices move: *where is the device?*
- Changing location: leverage mobile adhoc network (MANET)
- MANET is an ad hoc network that can change locations and configure itself on the fly. MANETs are mobile, they use wireless connections to connect to various networks.
- VANET (Vehicular Ad Hoc Network), is a type of MANET that allows vehicles to communicate with roadside equipment.

School of Engineering and Technology, University of Washington - Tacoma

L3.46

46

PERVASIVE SYSTEM TYPE:  
SENSOR NETWORKS

- Tens, to hundreds, to thousands of small nodes
- Simple: small memory/compute/communication capacity
- Wireless, battery powered (or battery-less)
- Limited: restricted communication, constrained power
- Equipped with sensing devices
- Some can act as actuators (control systems)
  - Example: enable sprinklers upon fire detection
- Sensor nodes organized in neighborhoods
- Scope of communication:
  - Node - neighborhood - system-wide

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.47

47

PERVASIVE SYSTEM TYPE:  
SENSOR NETWORKS - 2

- Collaborate to process sensor data in app-specific manner
- Provide mix of data collection and processing
- Nodes may implement a distributed database
- Database organization: centralized to decentralized
- In network processing: forward query to all sensor nodes along a tree to aggregate results and propagate to root
- Is aggregation simply data collection?
- Are all nodes homogeneous?
- Are all network links homogeneous?
- How do we setup a tree when nodes have heterogeneous power and network connection quality?

January 11, 2024

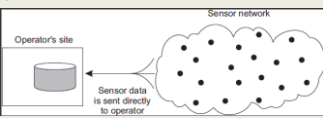

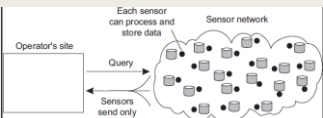

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.48

48

### CENTRALIZED VS. DECENTRALIZED DATA STORAGE

- Centralized:
- Decentralized:

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.49

49

### WHO AGGREGATES AND STORES DATA?

- Consider the **tradeoff space** for:
  - sensor network data storage and processing

**Centralized** ← | → **Decentralized**

- Single point-of-failure
- No node coordination
- No node processing or storage
- "Dumb" nodes
- Less expensive node
- More network traffic
- Nodes require high compute power
- "Smart" nodes
- Expensive nodes
- Less network traffic

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.50

50

### SENSOR NETWORKS - 3

- What are some unique requirements for sensor networks middleware?
  - Sensor networks may consist of different types of nodes with different functions
  - Nodes may often be in suspended state to save power
    - Duty cycles (1 to 30%), strict energy budgets
  - Synchronize communication with duty cycles
  - How do we manage membership when devices are offline?

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]
