

# TCSS 558: APPLIED DISTRIBUTED COMPUTING

## Types of Distributed Systems

Wes J. Lloyd  
School of Engineering  
& Technology (SET)  
University of Washington - Tacoma

The diagram illustrates seven common network topologies: Star (a central node connected to multiple peripheral nodes), Mesh (every node connected to every other node), Ring (nodes connected in a closed loop), Fully Connected (every node connected to every other node), Tree (a hierarchical structure of nodes), Bus (all nodes connected to a single central backbone), and Line (nodes connected in a linear sequence). Below these diagrams is a 3D illustration of a central server connected to multiple laptops in a star topology.

1

## OBJECTIVES – 1/11

- **Questions from 1/9**
- **Activity: Design goals of distributed systems**
- **Chapter 1.3 – Types of distributed systems**
  - HPC, Cluster, Grid, Cloud
  - Distributed information systems
    - Transactions
    - Application Integration: Shared files, DBs, RPC, RMI, Message-oriented middleware
  - Pervasive Systems
    - Ubiquitous computing systems
    - Mobile systems
    - Sensor networks

TCSS 558 OFFICE HOURS – WINTER 2024

- 26 of 32 survey responses so far – top 3 votes
  - #1: Tuesday afternoon before class (66.7%)
  - #2: Thursday afternoon before class (58.3%)
  - #3: Prefer office hours online via Zoom (41.7%)
  - Of note: Prefer office hours in-person (20.8%)
- Office hour - Tuesdays before class
  - ~2:30 – 3:30p CP 229 and Zoom
- Additional hours will be added as needed
  - In particular, we will try to add extra hours on Thursdays before class, or on Fridays via Zoom at peak times
- Also by email appointment: [willoyd@uw.edu](mailto:willoyd@uw.edu)

FEEDBACK FROM 1/9

- I plan to read the chapter before the next class and hope that between the textbook and the lectures, things will start to make more sense.
  - Great !
  - The focus is on Chapter 1 from the 3<sup>rd</sup> edition
- Load balancer / load balancing
  - Network traffic (client requests) are distributed across multiple servers to enable the application to scale horizontally
  - Improve application responsiveness, availability

January 11, 2024

LOAD BALANCING

Without Load Balancing

Does this system provide “location” transparency ?

Server 1 (overloaded)

Server 3

Server 4

image credit: <https://www.cloudflare.com/learning/performance/what-is-load-balancing/>

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.8

8

LOAD BALANCING - 2

- How do Load Balancers distribute user requests to nodes of a distributed system?
- Client request to the host routes to the load balancer
- Load balancer decides where to send the client's request based on capacity (how busy?), or location of user's data

The diagram illustrates the request flow: Clients (represented by computer icons) send requests through the Internet (represented by a cloud icon) to a Load Balancer (represented by a blue square with a circular arrow icon). The Load Balancer then distributes these requests to a group of Servers (represented by server rack icons).

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.9

9

METHODS LOAD BALANCERS USE TO ROUTE REQUESTS

The Five Most Common Load Balancing Methods

The diagram shows five methods for routing requests:

- Round Robin:** Requests are distributed in a circular sequence among servers.
- IP Hash:** Requests from the same client (IP address) are routed to the same server. Example IP addresses: 38.32.26.108, 49.42.65.921, 32.54.65.730.
- Least Connections:** Requests are routed to the server with the fewest active connections.
- Least Response Time:** Requests are routed to the server that responds fastest, indicated by clock icons.
- Least Bandwidth:** Requests are routed to the server with the least bandwidth usage. Example: 100 Mbps vs 30 Mbps.

January 11, 2024

------------------	---	-------

11

FEEDBACK - 2

- **Fault tolerance**
  - The ability of a system to continue functioning despite failures
  - Every computer will eventually fail
  - Redundancy is required (duplicate/extra servers)

January 11, 2024	TCSS558: Applied Distributed Computing [Winter 2024] School of Engineering and Technology, University of Washington - Tacoma	L3.12
------------------	---	-------

12

FAULT TOLERANCE

Fault Tolerance

The diagram shows a central server icon (three stacked rectangles) inside a grey circle. Below this circle are three server icons in a row. The leftmost and middle servers are blue, while the rightmost server is red and has a red triangle with an exclamation mark above it, indicating a failure. A blue box with the text '←== what is this component?' has an arrow pointing to the central server icon.

Image credit: <https://www.wallarm.com/what/what-is-fault-tolerance>

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.13

13

FAULT TOLERANCE - 2

The diagram illustrates a fault-tolerant web application architecture. At the top, a 'Web Application' icon (a monitor with 'WWW' on it) has a solid blue arrow pointing to a 'Load Balancer' (a circle with four arrows pointing outwards) and a dashed blue arrow pointing to a 'Failover' icon (a yellow triangle with an exclamation mark). Below the Load Balancer, three solid blue arrows point to three separate server racks labeled 'Datacenter A', 'Datacenter B', and 'Datacenter C'. To the right of the Load Balancer, a dashed blue arrow points from the 'Failover' icon to a single server rack labeled 'Standby Server'.

## CLASS ACTIVITY 1

- We will form groups of ~2-3
  - Remote students will use Canvas breakout rooms
- Each group will complete a MS Word Doc worksheet
- Add names to top of worksheet as they appear in Canvas
- Once completed, one person submits a PDF of the Word Doc to Canvas
- Grader will score all group members based on the uploaded PDF file
- To get started:
  - Log into Canvas, TCSS 558 A
  - Find worksheet under Class Activity 1

## TECHNOLOGY INNOVATIONS LEADING TO CLOUD COMPUTING

- **Super computers**
  - Huge multiprocessor systems with shared memory/RAM
  - Technically “not distributed”
  - Hardware all in one location
  - Initially expensive with proprietary designs
  - Traditionally supported HPC – High Performance Computing scientific applications
    - Weather forecasting
    - Molecular dynamics simulation
    - Protein modeling
  - Cost millions of dollars
  - Large systems consume MWs of electricity

L3.22

22

## INNOVATIONS LEADING TO CLOUD COMPUTING - 2

- **Cluster computing**
  - Group of interconnected homogeneous servers
  - Design emphasizes redundancy as server components are easily interchanged to keep overall system running
- **Grid computing**
  - Distributed heterogeneous servers organized into logical pools of loosely coupled resources connected by the internet
  - geographically dispersed
  - middleware software supports workload distribution and coordination functions
- **Virtualization**
- **Others**

Slides by Wes J. Lloyd

L3.12

## PUBLIC CLOUD COMPUTING

- Offers computing, storage, communication at ¢ per hour
- No premium to scale:

$$= \frac{1000 \text{ computers}}{1 \text{ computer}} @ \frac{1 \text{ hour}}{1000 \text{ hours}}$$

- Illusion of infinite scalability to cloud user
- As many computers as you can afford
- Leading examples:  
Amazon Web Services, Google App Engine, Microsoft Azure
- Amazon runs its own e-commerce on AWS!
- Billing models are becoming increasingly granular
  - By the hour, minute, second, now millisecond
  - Example: AWS Lambda \$0.0000002 per request (call)  
\$0.0000000021 to rent 128MB / 1-ms

January 11, 2024

School of Engineering and Technology, University of Washington - Tacoma

L3.25

25

## PUBLIC CLOUD COMPUTING - 2

- IaaS vs FaaS 1-month cost comparison - 30.4167 days/month

### **c4.large ec2 virtual machine (Infrastructure-as-a-Service - IaaS):**

2 vCPU cores, 3.75 GB RAM, Intel Xeon E5-2666 v3  
10¢ an hour, 24 hrs/day, billed by the second (60 sec min)  
Cost → \$73.00/month on-demand EC2 instance

### **AWS Lambda (Function-as-a-Service – FaaS serverless):**

2 vCPU cores, 3GB RAM, Intel Xeon E5-2666 v3 (maybe?)  
as 2,628,000 x 1-sec service calls  
\$0.00001667 GB/sec, billed by the millisecond (no min)

**What is the cost ???**

**\$131.43 (1.8x)**

January 11, 2024

School of Engineering and Technology, University of Washington - Tacoma

L3.26

26

## PAAS SERVICES IMPLEMENTATION

- PaaS services often built atop of IaaS
  - Amazon RDS, Heroku, Amazon ElastiCache
- Scalability
  - VM resources can support fluctuations in demand
- Dependability.
  - PaaS services built on highly available IaaS resources

L3.28

28

DISTRIBUTED INFORMATION SYSTEMS

- **Enterprise-wide** integrated applications (example: UW Workday)
  - Organizations confronted with too many applications
  - Interoperability among applications was difficult
  - Led to many middleware-based solutions
- Key concepts
  - **Component based architectures** - database components, processing components
  - **Distributed transaction** – Client wraps requests together, sends as single aggregated request
  - **Atomic: all or none** of the individual requests should be executed
- Different systems define different **action** primitives
  - Components of the atomic transaction
  - Examples: send, receive, forward, **READ, WRITE**, etc.

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.29

29

DISTRIBUTED INFORMATION SYSTEMS - 2

- Transaction primitives

Primitive	Description
BEGIN_TRANSACTION	Mark the start of a transaction
END_TRANSACTION	Terminate the transaction and try to commit
ABORT_TRANSACTION	Kill the transaction and restore the old values
READ	Read data from a file, a table, or otherwise
WRITE	Write data to a file, a table, or otherwise

- Transactions are all-or-nothing
  - All operations are executed
  - None are executed

January 11, 2024

School of Engineering and Technology, University of Washington - Tacoma

L3.31

31

## TRANSACTIONS: ACID PROPERTIES

- **A**tom<sup>i</sup>c: The transaction occurs indivisibly
- **C**onsistent: Transaction does not create variant states across nodes during slow updates (e.g. system variants)
  - Replicas remain constant until all updated
  - Two phase commit: data pushed first, then the commit
- **I**solated: Transactions do not interfere with each other
- **D**urable: Once a transaction commits, change are permanent
- **Nested transaction**: transaction constructed with many sub-transactions
- Follows a logical division of work
- Must support “rollback” of sub-transactions

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

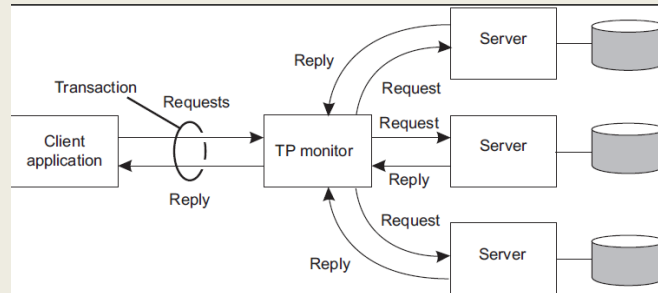

L3.32

32

## TRANSACTION PROCESSING MONITOR

- Allow an application to access multiple DBs via a transactional programming model
- **TP monitor**: coordinates commitment of sub-transactions using a distributed commit protocol (Ch. 8)
  - Saves application complexity from having to coordinate distributed transactions

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]

L3.34

34

ENTERPRISE APPLICATION INTEGRATION

- Dist. Info systems support application components direct communication with each other, not via databases
- **Communication mechanisms:**
  - **Remote procedure call** (RPC)
    - Local procedure call packaged as a message and sent to server
    - Supports distribution of function call processing
  - **Remote method invocations** (RMI)
    - Operates on objects instead of functions
- RPC and RMI – led to tight coupling
- Client and server endpoints must be up and running
- Interfaces coupled to specific languages and not *interoperable*
- This led to evolution of: **Message-oriented middleware** (MOM)

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.35

35

MESSAGE-ORIENTED MIDDLEWARE

- **Publish and subscribe systems:**
  - Rabbit MQ, Apache Kafka, AWS SQS
- Reduces tight coupling of RPC/RMI
- Applications indicate interest for specific type(s) of messages by sending requests to logical contact points
- Communication middleware delivers messages to subscribing applications

January 11, 2024

TCSS558: Applied Distributed Computing [Winter 2024]  
School of Engineering and Technology, University of Washington - Tacoma

L3.36

36

## CHALLENGES WITH VARIOUS APPLICATION INTEGRATION METHODS

- Integration via shared data files and transfers
  - Shared data files (e.g. XML)
  - Leads to file management challenges (concurrent updates, etc.)
- Shared database
  - Centralized DB, transactions to coordinate changes among users
  - Common data schema required – can be challenging to derive
  - For many reads and updates, shared DB becomes bottleneck (*limited scalability*)
- Remote procedure call – app A executes on and against app B data. App A lacks direct access to app B data.
- Messaging middleware - ensures nodes temporarily offline later on, can receive messages

PERVASIVE SYSTEMS

- Existing everywhere, widely adopted...
- Combine current network technologies, wireless computing, voice recognition, internet capabilities and AI to create an environment where connectivity of devices is embedded, unobtrusive, and always available
- Many sensors infer various aspects of a user’s behavior
  - Myriad of actuators to collect information, provide feedback
- TYPES OF PERVASIVE SYSTEMS:**
  - Ubiquitous computing systems
  - Mobile systems
  - Sensor networks

## PERVASIVE SYSTEM TYPE: UBIQUITOUS COMPUTING SYSTEMS

- Pervasive and continuously present
- Goal: embed processors everywhere (day-to-day objects) enabling them to communicate information
- Requirements for a ubiquitous computing system:
  - Distribution – devices are networked, distributed, and accessible transparently
  - Interaction – unobtrusive (low-key) between users and devices
  - Context awareness – optimizes interaction
  - Autonomy – devices operate autonomously, self-managed
  - Intelligence – system can handle wide range of dynamic actions and interactions

## PERVASIVE SYSTEM TYPE: MOBILE SYSTEMS

- Emphasis on mobile devices, e.g. smartphones, tablet computers
- New devices: remote controls, pagers, active badges, car equipment, various GPS-enabled devices,
- Devices move: *where is the device?*
- Changing location: leverage mobile adhoc network (MANET)
- MANET is an ad hoc network that can change locations and configure itself on the fly. MANETs are mobile, they use wireless connections to connect to various networks.
- VANET (Vehicular Ad Hoc Network), is a type of MANET that allows vehicles to communicate with roadside equipment.

## OBJECTIVES – 1/11

- Questions from 1/9
- Activity: Design goals of distributed systems
- Chapter 1.3 – Types of distributed systems
  - HPC, Cluster, Grid, Cloud
  - Distributed information systems
    - Transactions
    - Application Integration: Shared files, DBs, RPC, RMI, Message-oriented middleware
  - Pervasive Systems
    - Ubiquitous computing systems
    - Mobile systems
    - **Sensor networks**

PERVASIVE SYSTEM TYPE:  
SENSOR NETWORKS

- Tens, to hundreds, to thousands of small nodes
- Simple: small memory/compute/communication capacity
- Wireless, battery powered (or battery-less)
- Limited: restricted communication, constrained power
- Equipped with sensing devices
- Some can act as actuators (control systems)
  - Example: enable sprinklers upon fire detection
- Sensor nodes organized in neighborhoods
- Scope of communication:
  - Node – neighborhood – system-wide

PERVASIVE SYSTEM TYPE:  
SENSOR NETWORKS - 2

- Collaborate to process sensor data in app-specific manner
- Provide mix of data collection and processing
- Nodes may implement a distributed database
- Database organization: centralized to decentralized
- In network processing: forward query to all sensor nodes along a tree to aggregate results and propagate to root
- Is aggregation simply data collection?
- Are all nodes homogeneous?
- Are all network links homogeneous?
- How do we setup a tree when nodes have heterogeneous power and network connection quality?

## CENTRALIZED VS. DECENTRALIZED DATA STORAGE

■ **Centralized:**

■ **Decentralized:**

## WHO AGGREGATES AND STORES DATA?

■ Consider the tradeoff space for:

■ sensor network data storage and processing

Centralized

Decentralized

- Single point-of-failure
- No node coordination
- No node processing or storage
- “Dumb” nodes
- Less expensive node
- More network traffic

- Nodes require high compute power
- “Smart” nodes
- Expensive nodes
- Less network traffic

## SENSOR NETWORKS - 3

- What are some unique requirements for sensor networks middleware?
  - Sensor networks may consist of different types of nodes with different functions
  - Nodes may often be in suspended state to save power
    - Duty cycles (1 to 30%), strict energy budgets
  - Synchronize communication with duty cycles
  - How do we manage membership when devices are offline?
