OFFICE HOURS – FALL 2025

■ Thursdays:

■ 6:00 to 7:00 pm - CP 229 & Zoom

■ Friday – \*\*\* THIS WEEK \*\*\*

■ 11:00 am to 12:00 pm – ONLINE via Zoom

■ Or email for appointment

➤ Office Hours set based on Student Demographics survey feedback

➤ \* - Friday office hours may be adjusted or canceled due meeting conflicts or other obligations. Adjustments will be announced via Canvas.

TCSS 562 - Online Daily Feedback Survey - 10/5

Started: Oct 7 at 1:13am

Quiz Instructions

Question 1

0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

12345678910

Mostly Review To MeEqual New and ReviewMostly New to Me

Question 2

0.5 pts

Please rate the pace of today's class:

12345678910

SlowJust RightFast

L14.5

5

MATERIAL / PACE

Please classify your perspective on material covered in today's class (41 respondents, 27 in-person, 14 online):

1-mostly review, 5-equal new/review, 10-mostly new

Average – 5.46 (↓ - previous 5.64)

Please rate the pace of today's class:

1-slow, 5-just right, 10-fast

Average – 5.07 (↑ - previous 4.96)

FEEDBACK FROM 11/13

- Nitro does need a kernel? Is it like a real PC running on real hardware even though it's a VM ?
- Nitro VM's still have an operating system kernel
- They just don't use an amazon-kernel-image (aki) file
  - Aki images are legacy
- With AWS nitro (and also XEN in hvm mode), the Linux kernel is on the root filesystem under the /boot directory

November 18, 2025

School of Engineering and Technology, University of Washington - Tacoma

L14.7

7

HEY, CHAT-GPT:  
“ON AMAZON EC2 WHAT IS AN AKI?”

- An AKI is a bootable Linux kernel image used by older-generation EC2 instance types based on the paravirtual (PV) virtualization model. When launching a PV instance, you had to specify:
  - AMI – Amazon Machine Image (the root filesystem)
  - AKI – Amazon Kernel Image (the kernel the instance boots)
  - ARI – Amazon Ramdisk Image (optional initial ramdisk)
- Why AKIs existed?
  - Earlier EC2 instances (pre-XEN HVM virtualization) could not boot their own kernels directly. Instead, AWS provided a set of Amazon-managed kernels, each published as an AKI ID (e.g., aki-88aa75e1). The instance would boot using the AKI rather than kernel stored inside the AMI.
- Are AKIs still relevant?
  - Mostly no:
  - Modern EC2 instances use HVM (hardware virtualization).
  - HVM instances boot their own embedded kernel from the AMI, so AKIs and ARIs are unnecessary.
  - AWS has deprecated PV instances; AKI/ARI are rarely used today except for legacy workloads.

FEEDBACK - 2

- Quiz 2 only covers lecture 12-17 ?
- Can you provide several Qs related to critical sections that may appear in quiz 2?
- After each lecture, will repost slides:
  - For L13-17: will remove slides we did not cover that day
  - Will mark key slides with important content for quiz 2 with a green star:

TUTORIAL 5 – DUE NOV 16

- Introduction to Lambda II: Working with Files in S3, Cloud Trail, and Amazon Event Bridge Rules
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_5.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_5.pdf)
- Customize the Request object (add getters/setters)
  - Why do this instead of HashMap ?
- Import dependencies (jar files) into project for AWS S3
- Create an S3 Bucket
- Give your Lambda function(s) permission to work with S3
- Write to the CloudWatch logs
- Use of CloudTrail to generate S3 events
- Creating Event Bridge rule to capture events from CloudTrail
- Have the Event Bridge rule trigger a Lambda function with a static JSON input object (hard-coded filename)
- **Optional:** for the S3 PutObject event, dynamically extract the name of the file put to the S3 bucket for processing

L14.12

12

TUTORIAL 6 – NOV 23

- Introduction to Lambda III: Serverless Databases
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_6.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_6.pdf)
- Create and use Sqlite databases using sqlite3
- Deploy Lambda function with Sqlite3 database under /tmp
- Compare in-memory vs. file-based Sqlite DBs on Lambda
- Create an Amazon Aurora “Serverless” v2 MySQL database
- Using the AWS CloudShell in the same VPC (Region + availability zone) connect and interact your Aurora serverless database using the mysql CLI app
- Deploy an AWS Lambda function that uses the MySQL “serverless” database

School of Engineering and Technology, University of Washington - Tacoma

L14.13

13

TUTORIAL 7 – DEC 4

- Introduction to Docker
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_7.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_7.pdf)
- Must complete using c7i-flex.large ec2 instance & Ubuntu 24.04 (for cgroups v2)
- Use DOCX file for copying and pasting Docker install commands
- Topics:
  - Installing Docker
  - Creating a container using a Dockerfile
  - Using cgroups virtual filesystem to monitor CPU utilization of a container
  - Persisting container images to Docker Hub image repository
  - Container vertical scaling of CPU/memory resources
  - Testing container CPU and memory isolation

School of Engineering and Technology, University of Washington - Tacoma

L14.14

14

TUTORIAL COVERAGE

- Docker CLI → Docker Engine (dockerd) → containerd → runc
- Working with the docker CLI:
  - docker run create a container
  - docker ps -a list containers, find CONTAINER ID
  - docker exec --it run a process in an existing container
  - docker stop stop a container
  - docker kill kill a container
  - docker help list available commands
  - man docker Docker Linux manual pages

Commands:

|         |                                                                               |
|---------|-------------------------------------------------------------------------------|
| attach  | Attach local standard input, output, and error streams to a running container |
| build   | Build an image from a Dockerfile                                              |
| commit  | Create a new image from a container's changes                                 |
| cp      | Copy files/folders between a container and the local filesystem               |
| create  | Create a new container                                                        |
| deploy  | Deploy a new stack or update an existing stack                                |
| diff    | Inspect changes to files or directories on a container's filesystem           |
| events  | Get real time events from the server                                          |
| exec    | Run a command in a running container                                          |
| export  | Export a container's filesystem as a tar archive                              |
| history | Show the history of an image                                                  |
| images  | List images                                                                   |
| import  | Import the contents from a tarball to create a filesystem image               |
| info    | Display system-wide information                                               |
| inspect | Return low-level information on Docker objects                                |
| kill    | Kill one or more running containers                                           |
| load    | Load an image from a tar archive or STDIN                                     |
| login   | Log in to a Docker registry                                                   |
| logout  | Log out from a Docker registry                                                |
| logs    | Fetch the logs of a container                                                 |
| pause   | Pause all processes within one or more containers                             |
| port    | List port mappings or a specific mapping for the container                    |
| ps      | List containers                                                               |
| pull    | Pull an image or a repository from a registry                                 |
| push    | Push an image or a repository to a registry                                   |
| rename  | Rename a container                                                            |
| restart | Restart one or more containers                                                |
| rm      | Remove one or more containers                                                 |
| rmi     | Remove one or more images                                                     |
| run     | Run a command in a new container                                              |
| save    | Save one or more images to a tar archive (streamed to STDOUT by default)      |
| search  | Search the Docker Hub for images                                              |
| start   | Start one or more stopped containers                                          |
| stats   | Display a live stream of container(s) resource usage statistics               |
| stop    | Stop one or more running containers                                           |
| tag     | Create a tag TARGET_IMAGE that refers to SOURCE_IMAGE                         |
| top     | Display the running processes of a container                                  |
| unpause | Unpause all processes within one or more containers                           |
| update  | Update configuration of one or more containers                                |
| version | Show the Docker version information                                           |
| wait    | Block until one or more containers stop, then print their exit codes          |

Docker CLI

EC2 VIRTUALIZATION - NITRO

- Nitro based on Kernel-based-virtual-machines
  - Stripped down version of Linux KVM hypervisor
  - Uses KVM core kernel module
  - I/O access has a direct path to the device
- Goal: provide indistinguishable performance from bare metal
- There are 5 Nitro versions (v2 to v6)
- Article describes features and provides links to instance families (m, c, r, etc.) where it is possible to check the Nitro version for specific instance types to understand feature evolution
- <https://docs.aws.amazon.com/ec2/latest/instancetypes/ec2-nitro-instances.html>

## EC2 INSTANCE: NETWORK ACCESS

- Public IP address
- Elastic IPs
  - Costs: in-use FREE, not in-use ~12 ¢/day
  - Not in-use (e.g. “paused” EBS-backed instances)
- Security groups
  - E.g. firewall
- Identity access management (IAM)
  - AWS accounts, groups
- VPC / Subnet / Internet Gateway / Router
- NAT-Gateway

26

INSPECTING INSTANCE INFORMATION

- EC2 VMs run a local metadata service
- Can query instance metadata to self discover cloud config attributes
- **Version 2 (default) of the metadata service requires a token**
- Get Token:  
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api /token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"`
- Find your instance ID:  
curl -H "X-aws-ec2-metadata-token: \$TOKEN" http://169.254.169.254/  
  
curl -H "X-aws-ec2-metadata-token: \$TOKEN" http://169.254.169.254/latest/  
  
curl -H "X-aws-ec2-metadata-token: \$TOKEN" http://169.254.169.254/latest/meta-data/  
  
curl -H "X-aws-ec2-metadata-token: \$TOKEN" http://169.254.169.254/latest/meta-data/instance-id ; echo  
See: <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/configuring-instance-metadata-service.html#instance-metadata-retrieval-examples>

L14.27

27

SIMPLE STORAGE SERVICE (S3) 

- Key-value blob storage
- What is the difference vs. key-value stores (NoSQL DB)?
- Can mount an S3 bucket as a volume in Linux
  - Supports common file-system operations
- Provides eventual consistency, but now strong consistency
- Can store Lambda function state for life of container.

28

# AWS CLI

- Launch Ubuntu VM
  - Instances | Launch Instance
- Install the general AWS CLI
  - `sudo apt install awscli`
- Create config file  
[default]

```
aws_access_key_id = <access key id>
aws_secret_access_key = <secret access key>
region = us-east-1
```

## COPY DATA TO NEW DISK PARTITION

```
# now check if the partition has been created.
# it should be listed as /dev/nvme1n1p1:
ls /dev/nvme1n1*

# now copy the data to the partition
sudo dd if=vhd.img of=/dev/nvme1n1p1

# mount the disk
sudo mount /dev/nvme1n1p1 /mnt

# and check if the hello file is there
cat /mnt/hello.txt

# we were able to copy the disk image to the cloud
# and we never had to format the cloud disk
# this examples copies a filesystem from a local disk
# to the cloud disk
```

## COST SAVINGS MEASURES

- **From Tutorial 3:**
- **#1:** ALWAYS USE SPOT INSTANCES FOR COURSE/RESEARCH RELATED PROJECTS
- **#2:** NEVER LEAVE AN EBS VOLUME IN YOUR ACCOUNT THAT IS NOT ATTACHED TO A RUNNING VM
- **#3:** BE CAREFUL USING PERSISTENT REQUESTS FOR SPOT INSTANCES
- **#4:** TO SAVE/PERSIST DATA, USE EBS SNAPSHOTS AND THEN
- **#5:** DELETE EBS VOLUMES FOR TERMINATED EC2 INSTANCES.
- **#6:** UNUSED SNAPSHOTS AND UNUSED EBS VOLUMES SHOULD BE PROMPTLY DELETED !!
- **#7:** USE PERSISTENT SPOT REQUESTS AND THE “STOP” FEATURE TO PAUSE VMS DURING SHORT BREAKS

PRIVATE CLOUD NETWORKING

- For institutions with in-house private clouds

The diagram illustrates a private cloud networking architecture. On the left, a cloud labeled 'private cloud network' contains three server icons and three desktop computer icons labeled 'in-office users'. A blue router icon is positioned at the edge of this cloud. A vertical dashed line separates the private network from a central globe icon labeled 'corporate Internet connection'. To the right of the globe, another blue router icon is shown. This router is connected to two user icons: one with a desktop computer labeled 'remote users' and another with a smartphone labeled 'users accessing cloud services remotely'.

School of Engineering and Technology, University of Washington - Tacoma

L14.48

48

## PUBLIC CLOUD NETWORKING

- Resources can be extended by adding public cloud
- Places further dependency on the internet to provide connectivity

The diagram illustrates the architecture of public cloud networking. It shows a 'private cloud network' containing 'in-office users' connected to a 'corporate Internet connection' (represented by a globe with red nodes). 'remote users' are also shown accessing cloud services remotely through the same corporate Internet connection. Below this, a 'cloud provider network' (represented by a cloud shape containing server racks) is connected to the corporate Internet connection via a 'cloud provider Internet connection' (another globe with red nodes). The entire system relies on the Internet for connectivity between the private cloud and the public cloud provider.

|                   |                                                                                                                                               |        |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------|

|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------|

49

## INTERNETWORKING KEY POINTS

- Cloud consumers and providers typically communicate via the internet
- Decentralized provisioning and management model is not controlled by the cloud consumers or providers
- Inter-networking (internet) relies on connectionless packet switching and route-based interconnectivity
- Routers and switches support communication
- Network bandwidth and latency influence QoS, which is heavily impacted by network congestion

|                   |                                                                                                                                               |        |

51

## 2. DATA CENTER TECHNOLOGY

- Grouping servers together (clusters):
  - Enables power sharing
  - Higher efficiency in shared IT resource usage (less duplication of effort)
  - Improved accessibility and organization
- Key components:
  - Virtualized and physical server resources
  - Standardized, modular hardware
  - Automation support: enable server provisioning, configuration, patching, monitoring without supervision... **tool/API support is desirable**

53

# DATA CENTER TECHNOLOGY – KEY COMPONENTS

- Remote operation / management
- High availability support:** \*\*redundant everything\*\*  
Includes: power supplies, cabling, environmental control systems, communication links, duplicate warm replica HW
- Secure design:** physical and logical access control
- Servers:** rackmount, etc.
- Storage:** hard disk arrays (RAID)
- storage area network (SAN): disk array w/ multiple servers (individual nodes w/ disks) and a dedicated network
- network attached storage (NAS): inexpensive single node with collection of disks, provides shared filesystems, for NFS, etc.
- Network hardware:** backbone routers (WAN to LAN connectivity), firewalls, VPN gateways, managed switches/routers

# 3. VIRTUALIZATION TECHNOLOGY

- Convert a physical IT resource into a virtual IT resource
- Servers, storage, network, power (virtual UPSs)
- Virtualization supports:
  - Hardware independence
  - Server consolidation
  - Resource replication
  - Resource pooling
  - Elastic scalability
- Virtual servers
  - Operating-system based virtualization
  - Hardware-based virtualization

57

# KEY VIRTUALIZATION TRADEOFF

■ Tradeoff space:

**What is the “right” level of abstraction in the cloud for sharing resources with users?**

**Degree of Hardware Abstraction**

**Abstraction Concerns:**

- Overhead
- Performance
- Isolation
- Security

November 18, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.58

58

ABSTRACTION CONCERNS

- **Overhead with too many instances w/ heavy abstractions**
  - Too many instances using a heavy abstraction can lead to hidden resource utilization and waste
  - Example: Dedicated server with 48 VMs each with separate instance of Ubuntu Linux
  - Idle VMs can reduce performance of co-resident jobs/tasks
- **“Virtualization” Overhead**
  - Cost of virtualization an OS instance
  - Overhead has dropped from ~100% to ~1% over last decade
- **Performance**
  - Impacted by weight of abstraction and virtualization overhead

November 18, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.59

59

ABSTRACTION CONCERNS - 2

- **Isolation**
  - From others:  
What user A does should not impact user B in any noticeable way
- **Security**
  - User A and user B's data should be always separate
  - User A's actions are not perceivable by User B

School of Engineering and Technology, University of Washington - Tacoma

L14.60

60

TYPES OF ABSTRACTION IN THE CLOUD

- **Virtual Machines** – original IaaS cloud abstraction
- **OS and Application Containers** – seen with CaaS
  - OS Container – replacement for VM, mimics full OS instance, heavier
  - OS containers run 100s of processes just like a VM
  - App Container – Docker: packages dependencies to easily transport and run an application anywhere
  - Application containers run only a few processes
- **Micro VMs** – FaaS / CaaS
  - Lighter weight alternative to full VM (KVM, XEN, VirtualBox)
  - Firecracker
- **Unikernel Operating Systems** – research mostly
  - Single process, multi-thread operating system
  - Designed for cloud, objective to reduce overhead of running too many OS instances

School of Engineering and Technology, University of Washington - Tacoma

L14.61

61

VIRTUAL MACHINES

- Type 1 hypervisor
  - Typically involves a special virtualization kernel that runs directly on the system to share the underlying machine with many guest VMs
  - Paravirtualization introduced to directly share system resources with guests bypassing full emulation
  - VM becomes equal participant in sharing the network card for example
- Type 2 hypervisor
  - Typically involves the **Full Virtualization** of the guest, where everything is simulated/emulated
- **Hardware level support** (i.e. features introduced on CPUs) have made virtualization faster in all respects shrinking virtualization overhead

November 18, 2025

# TYPE 1 HYPERVISOR

- Acts as a control program
- Miniature OS kernel that manages VMs
- **\*\* Boots and runs on bare metal \*\***
- Also known as Virtual Machine Monitor (VMM)
- **Paravirtualization:** Kernel includes I/O drivers
- VM guest OSes must use special kernel to interoperate
- Paravirtualization provides hooks to the guest VMs
- Kernel traps instructions (i.e. device I/O) to implement sharing & multiplexing
- User mode instructions run directly on the CPU
- Objective: minimize virtualization overhead
- Classic example is XEN (dom0 kernel)

|                   |                                                                                                                                               |        |

64

COMMON VMMS:  
PARAVIRTUALIZATION

- **TYPE 1 Hypervisor**
  - XEN
  - Citrix Xen-server (a commercial version of XEN)
  - VMWare ESXi
  - KVM (virtualization support in kernel)
- Paravirtual I/O drivers introduced
  - XEN
  - KVM
  - Virtualbox

L14.65

65

66

XEN - 2

- VMs managed as “domains”
- Domain 0 is the hypervisor domain
  - Host OS is installed to run on bare-metal, but doesn’t directly facilitate virtualization (*unlike KVM*)
- Domains 1..n are guests (VMs) – not bare-metal

```
xentop - 17:53:48 Xen 3.1.2-398.el5
3 domains: 1 running, 2 blocked, 0 paused, 0 crashed, 0 dying, 0 shutdown
Mem: 8379564k total, 8377876k used, 1688k free CPUs: 4 @ 2400MHz
```

|  | NAME     | STATE    | CPU(sec) | CPU(%) | MEM(k) | MEM(%)  | MAXMEM(k) | MAXMEM(%) | VCPUS |   |
|--|----------|----------|----------|--------|--------|---------|-----------|-----------|-------|---|

67

XEN - 3

- Physical machine boots special XEN kernel
- Kernel provides paravirtual API to manage CPU & device multiplexing
- Guests require modified XEN-aware kernels
- Xen supports full-virtualization for unmodified OS guests in hvm mode
- Amazon EC2 largely based on modified version of XEN hypervisor (EC2 gens 1-4)
- XEN provides its own CPU schedulers, I/O scheduling

L14.69

69

TYPE 2 HYPERVISOR

■ Problem: Original x86 CPUs could not trap special instructions

■ Instructions not specially marked

■ Solution: Use Full Virtualization

■ Trap ALL instructions

■ “Fully” simulate entire computer

■ Tradeoff: Higher Overhead

■ Benefit: Can virtualize any operating system without modification

## CHECK FOR VIRTUALIZATION SUPPORT

- See:  
<https://cyberciti.biz/faq/linux-xen-vmware-kvm-intel-vt-amd-v-support>
- # check for Intel VT CPU virtualization extensions on Linux  
`grep -color vmx /proc/cpuinfo`
- # check for AMD V CPU virtualization extensions on Linux  
`grep -color svm /proc/cpuinfo`
- Also see 'lscpu' → "Virtualization:"
- Other Intel CPU features that help virtualization:  
`ept vpid tpr_shadow flexpriority vnmi`

L14.71

71

## KERNEL BASED VIRTUAL MACHINES (KVM)

- x86 HW notoriously difficult to virtualize
- Extensions added to 64-bit Intel/AMD CPUs
  - Provides hardware assisted virtualization
  - New "guest" operating mode
  - Hardware state switch
  - Exit reason reporting
  - Intel/AMD implementations different
    - Linux uses vendor specific kernel modules

L14.72

72

73

## KVM - 3

- **KVM has /dev/kvm device file node**
  - **Linux character device, with operations:**
    - Create new VM
    - Allocate memory to VM
    - Read/write virtual CPU registers
    - Inject interrupts into vCPUs
    - Running vCPUs
- **VMs run as Linux processes**
  - **Scheduled by host Linux OS**
  - **Can be pinned to specific cores with “taskset”**

|                   |                                                                                                                                                |        |

74

## KVM PARAVIRTUALIZED I/O

- KVM – Virtio
  - Custom Linux based paravirtual device drivers
  - Supersedes QEMU hardware emulation (full virt.)
  - Based on XEN paravirtualized I/O
  - Custom block device driver provides paravirtual device emulation
    - Virtual bus (memory ring buffer)
    - Requires hypercall facility
    - Direct access to memory

School of Engineering and Technology, University of Washington - Tacoma

L14.75

75

## KVM DIFFERENCES FROM XEN

- KVM requires CPU VMX support
  - Virtualization management extensions
- KVM can virtualize any OS without special kernels
  - Less invasive
- KVM was originally separate from the Linux kernel, but then integrated
- KVM is type 1 hypervisor because the machine boots Linux which has integrated support for virtualization
- Different than XEN because XEN kernel alone is not a full-fledged OS

School of Engineering and Technology, University of Washington - Tacoma

L14.76

76

## KVM ENHANCEMENTS

- Paravirtualized device drivers
  - Virtio
- Guest Symmetric Multiprocessor (SMP) support
  - Leverages multiple on-board CPUs
  - Supported as of Linux 2.6.23
- VM Live Migration
- Linux scheduler integration
  - Optimize scheduler with knowledge that KVM processes are virtual machines

## FIRECRACKER MICRO VM

From <https://firecracker-microvm.github.io/>

The following diagram depicts an example host running Firecracker microVMs.

78

FIRECRACKER MICRO VM

- Provides a virtual machine monitor (VMM) (i.e. hypervisor) using KVM to create and manage microVMs
- Has a minimalist design with goals to improve security, decreases the startup time, and increases hardware utilization
- Excludes unnecessary devices and guest functionality to reduce memory footprint and attack surface area of each microVM
- Supports boot time of <125ms, <5 MiB memory footprint
- Can run 100s of microVMs on a host, launching up to 150/sec
- Is available on 64-bit Intel, AMD, and Arm CPUs
- Used to host AWS Lambda and AWS Fargate
- Has been open sourced under the Apache 2.0 license

November 18, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.79

79

FIRECRACKER - 2

- Minimalistic
- MicroVMs run as separate processes on the host
- Only 5 emulated devices are available: virtio-net, virtio-block, virtio-vsock, serial console, and a minimal keyboard controller used only to stop the microVM
- Rate limiters can be created and configured to provision resources to support bursts or specific bandwidth/operation limitations
- Configuration
- A RESTful API enables common actions such as configuring the number of vCPUs or launching microVMs
- A metadata service between the host and guest provides configuration information
