

# TCSS 462/562: (SOFTWARE ENGINEERING FOR) CLOUD COMPUTING

## Cloud Enabling Technology & Containerization

Wes J. Lloyd  
School of Engineering and Technology  
University of Washington - Tacoma

1

## OFFICE HOURS – FALL 2025

- Thursdays:
  - 6:00 to 7:00 pm - CP 229 & Zoom
- Friday – \*\*\* THIS WEEK \*\*\*
  - 11:00 am to 12:00 pm – ONLINE via Zoom
- Or email for appointment

➤ Office Hours set based on Student Demographics survey feedback

➤ \* - Friday office hours may be adjusted or canceled due meeting conflicts or other obligations. Adjustments will be announced via Canvas.

Upcoming Assignments

Class Activity 1 – Implicit vs. Explicit Parallelism  
Available until Oct 11 at 11:59pm | Due Oct 7 at 7:50pm | ~10 pts

Tutorial 1 - Linux  
Available until Oct 19 at 11:59pm | Due Oct 15 at 11:59pm | ~20 pts

Past Assignments

TCSS 562 - Online Daily Feedback Survey - 10/5  
Available until Dec 18 at 11:59pm | Due Oct 6 at 8:59pm | ~1 pts

TCSS 562 - Online Daily Feedback Survey - 9/30  
Available until Dec 18 at 11:59pm | Due Oct 4 at 8:59pm | ~1 pts

TCSS 562 - Online Daily Feedback Survey - 10/5

Started: Oct 7 at 1:13am

Quiz Instructions

Question 1

0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

12345678910

Mostly Review To MeEqual New and ReviewMostly New to Me

Question 2

0.5 pts

Please rate the pace of today's class:

12345678910

SlowJust RightFast

November 20, 2025

5

MATERIAL / PACE

■ Please classify your perspective on material covered in today's class (41 respondents, 27 in-person, 14 online):

■ 1-mostly review, 5-equal new/review, 10-mostly new

■ **Average – 6.46 (↑ - previous 5.64)**

■ Please rate the pace of today's class:

■ 1-slow, 5-just right, 10-fast

■ **Average – 5.29 (↑ - previous 4.96)**

L15.6

6

FEEDBACK FROM 11/18

- Can a Virtual Private Cloud (VPC) span region?  
We saw it can span availability zone A and B, can it span across regions like us-east-1 and us-east-2 ?
- No. Currently VPCs can only span across multiple availability zones (Azs) within a single region
- This limitation forces deployments to be fully replicated in distinct regions
- If one region fails, application hosting can fail-over to another region
- This often involves Domain-Name-Server (DNS) level load balancing
- Amazon Route 53 is a managed DNS service for this purpose

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.7

7

OBJECTIVES – 11/20

- Questions from 11/18
- **Tutorials Questions**
- Class Presentations Schedule -  
Cloud Technology or Research Paper Review
- Ch. 5: Cloud Enabling Technology
- Containerization
- Container Profiler

November 20, 2025

School of Engineering and Technology, University of Washington - Tacoma

L15.8

8

TUTORIAL 5 – CLOSING NOV 21 4:59AM

- Introduction to Lambda II: Working with Files in S3, Cloud Trail, and Amazon Event Bridge Rules
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_5.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_5.pdf)
- Customize the Request object (add getters/setters)
  - Why do this instead of HashMap ?
- Import dependencies (jar files) into project for AWS S3
- Create an S3 Bucket
- Give your Lambda function(s) permission to work with S3
- Write to the CloudWatch logs
- Use of CloudTrail to generate S3 events
- Creating Event Bridge rule to capture events from CloudTrail
- Have the Event Bridge rule trigger a Lambda function with a static JSON input object (hard-coded filename)
- **Optional:** for the S3 PutObject event, dynamically extract the name of the file put to the S3 bucket for processing

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.9

9

TUTORIAL 6 – NOV 23

- Introduction to Lambda III: Serverless Databases
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_6.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_6.pdf)
- Create and use Sqlite databases using sqlite3
- Deploy Lambda function with Sqlite3 database under /tmp
- Compare in-memory vs. file-based Sqlite DBs on Lambda
- Create an Amazon Aurora “Serverless” v2 MySQL database
- Using the AWS CloudShell in the same VPC (Region + availability zone) connect and interact your Aurora serverless database using the mysql CLI app
- Deploy an AWS Lambda function that uses the MySQL “serverless” database

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.10

10

TUTORIAL 7 – DEC 4

- Introduction to Docker
- [https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462\\_562\\_f2025\\_tutorial\\_7.pdf](https://faculty.washington.edu/wlloyd/courses/tcss562/tutorials/TCSS462_562_f2025_tutorial_7.pdf)
- Must complete using c7i-flex.large ec2 instance & Ubuntu 24.04 (for cgroups v2)
- Use DOCX file for copying and pasting Docker install commands
- Topics:
  - Installing Docker
  - Creating a container using a Dockerfile
  - Using cgroups virtual filesystem to monitor CPU utilization of a container
  - Persisting container images to Docker Hub image repository
  - Container vertical scaling of CPU/memory resources
  - Testing container CPU and memory isolation

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.11

11

TUTORIAL COVERAGE

- Docker CLI → Docker Engine (dockerd) → containerd → runc
- Working with the docker CLI:
  - docker run            create a container
  - docker ps -a        list containers, find CONTAINER ID
  - docker exec --it    run a process in an existing container
  - docker stop        stop a container
  - docker kill        kill a container
  - docker help        list available commands
  - man docker        Docker Linux manual pages

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.12

12

Commands:

attach

Build an image from a Dockerfile

build

Create a new image from a container's changes

commit

Copy files/folders between a container and the local filesystem

cp

Create a new container

create

Deploy a new stack or update an existing stack

deploy

Inspect changes to files or directories on a container's filesystem

diff

Get real time events from the server

events

Run a command in a running container

exec

Export a container's filesystem as a tar archive

export

Show the history of an image

history

List images

images

Import the contents from a tarball to create a filesystem image

import

Display system-wide information

info

Return low-level information on Docker objects

inspect

Kill one or more running containers

kill

Load an image from a tar archive or STDIN

load

Log in to a Docker registry

login

Log out from a Docker registry

logout

Fetch the logs of a container

logs

Pause all processes within one or more containers

pause

List port mappings or a specific mapping for the container

port

List containers

ps

Pull an image or a repository from a registry

pull

Push an image or a repository to a registry

push

Rename a container

rename

Restart one or more containers

restart

Remove one or more containers

rm

Remove one or more images

rmi

Run a command in a new container

run

Save one or more images to a tar archive (streamed to STDOUT by default)

save

Search the Docker Hub for images

search

Start one or more stopped containers

start

Display a live stream of container(s) resource usage statistics

stats

Stop one or more running containers

stop

Create a tag TARGET\_IMAGE that refers to SOURCE\_IMAGE

tag

Display the running processes of a container

top

Unpause all processes within one or more containers

unpause

Update configuration of one or more containers

update

Show the Docker version information

version

Block until one or more containers stop, then print their exit codes

wait

Docker CLI

13

TUTORIAL 7

■ Tutorial introduces use of two common Linux performance benchmark applications

■ stress-ng

■ 100s of CPU, memory, disk, network stress tests

■ Sysbench

■ Used in tutorial for memory stress test

L15.15

15

## GROUP PRESENTATION

- TWO OPTIONS:
- *Cloud technology presentation*
- *Cloud research paper presentation*
  - Recent & suggested papers will be posted at:  
<http://faculty.washington.edu/wlloyd/courses/tcss562/papers/>
- **Submit presentation type and topics (paper or technology) with desired dates of presentation via Canvas by:  
*Tuesday November 18<sup>th</sup> @ 11:59pm***
- Presentation dates:
  - Tuesday November 25
  - Tuesday December 2\*, Thursday December 4
    - \* - day of quiz 2. only 1 presentation slot

November 20, 2025

School of Engineering and Technology, University of Washington - Tacoma

L15.16

16

PRESENTATION SCHEDULE

▪ <Tuesday November 25>

1. Team 4: Xiaoling Wei, Bohan Xiong, Xu Zhu  
Research paper: *Serverless Replication of Object Storage across Multi-Vendor Clouds and Regions*  
2. Team 1: William Hay  
Cloud Technology: *Amazon Athena*

▪ <Tuesday December 2>

1. Team 5: Sparsha Jha, Chris Biju  
Cloud Technology: *Intelligent Optimization of Distributed Pipeline Execution in Serverless Platforms: A Predictive Model Approach*

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.17

17

PRESENTATION SCHEDULE - 2

▪ <Thursday December 4>

1. Team 3: Jiameng Li, Naomi Nottingham, Headley Brissett  
Research paper: *A Perfect Fit? – Towards Containers on Microkernels*  
2. Team 2: Ruby Plangphatthanaphanit, Junjia Li, Ari Yin  
Cloud Technology: *CI/CD In the Cloud (GitHub Actions + Cloud Deploy)*  
3. Team 8: Aamena Suzzane, Dhruva Bhat  
Research paper: *CoFaaS: Automatic Transformation-based Consolidation of Serverless Functions*  
4. Team 6: Han Zhang, Sahil Bhatt, Pengcheng Cao  
Cloud Technology: *AWS Amplify*

November 20, 2025

School of Engineering and Technology, University of Washington - Tacoma

L15.18

18

OBJECTIVES – 11/20

- Questions from 11/18
- Tutorials Questions
- Class Presentations Schedule - Cloud Technology or Research Paper Review
- Ch. 5: Cloud Enabling Technology
- Containerization
- Container Profiler

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.19

19

CLOUD ENABLING TECHNOLOGY

- Broadband networks and internet architecture
- Data center technology
- Virtualization technology
- Multitenant technology
- Web/web services technology

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L15.20

20

VIRTUALIZATION MANAGEMENT

- Virtual infrastructure management (VIM) tools
- Tools that manage pools of virtual machines, resources, etc.
- Private cloud software systems can be considered as a VIM

- Considerations:
- Performance overhead
  - Paravirtualization: custom OS kernels, I/O passed directly to HW w/ special drivers
- Hardware compatibility for virtualization
- Portability: virtual resources tend to be difficult to migrate cross-clouds

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.21

21

VIRTUAL INFRASTRUCTURE MANAGEMENT (VIM)

- Middleware to manage virtual machines and infrastructure of IaaS “clouds”

- Examples
  - OpenNebula
  - Nimbus
  - Eucalyptus
  - OpenStack

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.22

22

VIM FEATURES

- Create/destroy VM Instances
- Image repository
  - Create/Destroy/Update images
  - Image persistence
- Contextualization of VMs
  - Networking address assignment
    - DHCP / Static IPs
  - Manage SSH keys

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.23

23

VIM FEATURES - 2

- Virtual network configuration/management
  - Public/Private IP address assignment
  - Virtual firewall management
    - Configure/support isolated VLANs (private clusters)
- Support common virtual machine managers (VMMs)
  - XEN, KVM, VMware
  - Support via libvirt library

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.24

24

VIM FEATURES - 3

- Shared “Elastic” block storage
  - Facility to create/update/delete VM disk volumes
    - Amazon EBS
    - Eucalyptus SC
    - OpenStack Volume Controller

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.25

25

CONTAINER ORCHESTRATION  
FRAMEWORKS

- Middleware to manage Docker application container deployments across virtual clusters of Docker hosts (VMs)
- Considered Infrastructure-as-a-Service
- Opensource
  - Kubernetes framework
  - Docker swarm
  - Apache Mesos/Marathon
- Proprietary
  - Amazon Elastic Container Service

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.26

26

## CONTAINER SERVICES

- Public cloud container cluster services
  - Azure Kubernetes Service (AKS)
  - Amazon Elastic Container Service for Kubernetes (EKS)
  - Google Kubernetes Engine (GKE)
- Container-as-a-Service
  - Azure Container Instances (ACI – April 2018)
  - AWS Fargate (November 2017)
  - Google Kubernetes Engine Serverless Add-on (alpha-July 2018)

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.27

27

## CLOUD ENABLING TECHNOLOGY

- *Adapted from Ch. 5 from Cloud Computing Concepts, Technology & Architecture*
- Broadband networks and internet architecture
- Data center technology
- Virtualization technology
- Multitenant technology
- Web/web services technology

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.28

28

4. MULTITENANT APPLICATIONS

- Each tenant (like in an apartment) has their own view of the application
- Tenants are unaware of their neighbors
- Tenants can only access their data, no access to data and configuration that is not their own
- Customizable features
  - UI, business process, data model, access control
- Application architecture
  - User isolation, data security, recovery/backup by tenant, scalability for a tenant, for tenants, metered usage, data tier isolation

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.29

29

MULTITENANT APPS - 2

- Forms the basis for SaaS (applications)

## CLOUD ENABLING TECHNOLOGY

- *Adapted from Ch. 5 from Cloud Computing Concepts, Technology & Architecture*
- Broadband networks and internet architecture
- Data center technology
- Virtualization technology
- Multitenant technology
- Web/web services technology

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.31

31

## 5. WEB SERVICES/WEB

- Web services technology is a key foundation of cloud computing's "as-a-service" cloud delivery model
- SOAP – “Simple” object access protocol
  - First generation web services
  - WSDL – web services description language
  - UDDI – universal description discovery and integration
  - SOAP services have their own unique interfaces
- REST – instead of defining a custom technical interface REST services are built on the use of HTTP protocol
- HTTP GET, PUT, POST, DELETE

November 20, 2025

TCSS462/562:(Software Engineering for) Cloud Computing [Fall 2025]  
School of Engineering and Technology, University of Washington - Tacoma

L14.32

32

## HYPERTEXT TRANSPORT PROTOCOL (HTTP)

- An ASCII-based request/reply protocol for transferring information on the web
- HTTP request includes:
  - request method (GET, POST, etc.)
  - Uniform Resource Identifier (URI)
  - HTTP protocol version understood by the client
  - headers—extra info regarding transfer request
- HTTP response from server
  - Protocol version & status code →
  - Response headers
  - Response body

**HTTP status codes:**  
2xx — *all is well*  
3xx — *resource moved*  
4xx — *access problem*  
5xx — *server error*

|                   |                                                                                                                                               |        |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------|

|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------|

33

## REST: REPRESENTATIONAL STATE TRANSFER

- Web services protocol
- *Supersedes SOAP* – Simple Object Access Protocol
- Access and manipulate web resources with a predefined set of stateless operations (known as web services)
- Requests are made to a URI
- Responses are most often in JSON, but can also be HTML, ASCII text, XML, no real limits as long as text-based
- HTTP verbs: GET, POST, PUT, DELETE, ...

|                   |                                                                                                                                               |        |

# REST CLIMATE SERVICES EXAMPLE

■ USDA  
Lat/Long  
Climate  
Service  
Demo

■ Just provide  
a Lat/Long

```
// REST/JSON
// Request climate data for Washington

{
  "parameter": [
    {
      "name": "latitude",
      "value": 47.2529
    },
    {
      "name": "longitude",
      "value": -122.4443
    }
  ]
}
```

REST - 2

- App manipulates one or more types of resources.
- Everything the app does can be characterized as some kind of operation on one or more resources.
- Frequently services are CRUD operations (create/read/update/delete)
  - Create a new resource
  - Read resource(s) matching criterion
  - Update data associated with some resource
  - Destroy a particular a resource
- Resources are often implemented as objects in OO languages

REST ARCHITECTURAL ADVANTAGES

- **Performance:** component interactions can be the dominant factor in user-perceived performance and network efficiency
- **Scalability:** to support large numbers of services and interactions among them
- **Simplicity:** of the Uniform Interface
- **Modifiability:** of services to meet changing needs (even while the application is running)
- **Visibility:** of communication between services
- **Portability:** of services by redeployment
- **Reliability:** resists failure at the system level as redundancy of infrastructure is easy to ensure

MOTIVATION FOR CONTAINERIZATION★

- Containers provide “light-weight” alternative to full OS virtualization provided by a VM hypervisor
- Containers do not provide a full “machine”
- Instead they use operating system constructs to provide “sand boxes” for execution
  - Linux cgroups, namespaces, etc.
- Containers can run on bare metal, or atop of VMs

WHAT IS A CONTAINER? ★

According to NIST (National Institute of Standards Technology)

- **Virtualization:** the simulation of the software and/or hardware upon which other software runs. (800-125)
- **System Virtual Machine:** A System Virtual Machine (VM) is a software implementation of a complete system platform that supports the execution of a complete operating system and corresponding applications in a cloud. (800-180 draft)
- **Operating System Virtualization** (aka OS Container): Provide multiple virtualized OSES above a single shared kernel (800-190). E.g., Solaris Zone, FreeBSD Jails, LXC
- **Application Virtualization** (aka Application Containers): Same shared kernel is exposed to multiple discrete instances (800-180 draft). E.g., Docker (containerd), rkt

OPERATING SYSTEM CONTAINERS ★

- Virtual environments: share the host kernel
- Provide user space isolation
- Replacement for VMs: run multiple processes, services
- Mix different Linux distros on same host

Examples: LXC,  
OpenVZ,  
Linux Vserver,  
BSD Jails,  
Solaris zones

APPLICATION CONTAINERS

- Designed to package and run a single service
- All containers share host kernel
- Subtle differences from operating system containers
- Examples: Docker, Rocket
- Docker: runs a single process on creation
- OS containers: run many OS services, for an entire OS
- Create application containers for each component of an app
- Supports a micro-services architecture
- DevOPS: developers can package their own components in application containers
- Supports horizontal and vertical scaling

School of Engineering and Technology, University of Washington - Tacoma

L15.51

51

APPLICATION CONTAINERS - 2

- Container images are “layered”
- Base image: common for all components
- Add layers that are specific for components, services as needed
- Layering promotes reuse
- Reduces duplication of data across images

The diagram illustrates the layered architecture of container images. It shows a stack of blocks representing different layers. From bottom to top, the layers are: 'Kernel' (the base), 'Debian' (labeled 'bootts'), 'Base Image', 'add emacs Image', 'add Apache Image', and 'writable Container Image'. An arrow points from the 'writable Container Image' block to the text 'references parent image', indicating that the container image references its parent image.

54

ORIGINAL DOCKER ENGINE IMPLEMENTATION

▪ (1) Original Docker engine relied on LXC

▪ LXC itself is a containerization tool predating Docker

▪ Original Docker API just called it

▪ LXC originally provided access to Linux kernel features: namespaces and cgroups

▪ LXC was Linux specific – caused issues if wanting to be multi-platform

▪ Docker implemented their own replacement for LXC

L15.28

OPEN CONTAINER INITIATIVE (OCI)

- OCI created container standards for:
  - Image specification
  - Container runtime specification
- Docker 1.1 (2016): Docker refactored the docker engine to be compliant with OCI standards
  - Essentially this introduced abstraction layers (i.e. generic interfaces that map to the implementation) so that Docker’s design conformed to the OCI standard
- Runc was added to implement the OCI container runtime spec
  - Provides small, lightweight wrapper for libcontainer
  - Can build and run OCI compliant containers directly using runc provided in Docker, but it is “bare bones” and low-level.
    - The Docker API is much more user friendly
- Support for OCI compliant images was added to Containerd

School of Engineering and Technology, University of Washington - Tacoma

L15.57

57

CREATING A CONTAINER

```
$ docker run -it --rm tcss558client sh
```

- Docker CLI posts request to **Docker daemon**
- Daemon calls **containerd**
- Containerd** passes of request to **runc**
  - Containerd** converts docker image into OCI compliant bundle
  - This step would allow any OCI compliant container to be plugged into the back-end
- Runc** interfaces with the Linux kernel (namespaces, cgroups, etc.) to create container
- Shim**: once a container is created, runc exits
  - Shim remains as a daemonless stub to implement the container
  - Allows Docker to be upgraded w/o stopping the container !!!

```
graph TD
    client["$ Docker client"] <--> dockerd
    dockerd <--> containerd
    containerd <--> shim
    shim <--> runc
    runc <--> namespaces[Namespaces]
    runc <--> capabilities[Capabilities]
    runc <--> cgroups[cgroups]
    namespaces <--> host[Host Kernel]
    capabilities <--> host
    cgroups <--> host
```

58

CREATING A CONTAINER - 2

The diagram illustrates the Containerd Integration Architecture. It shows a flow from 'Docker CLI/UI' to 'Docker Engine', which then connects to 'Containerd'. 'Containerd' is shown with an arrow pointing to a stack of containers, labeled 'Runc and other OCI runtimes'.

- Docker CLI: interfaces with **dockerd** daemon
- Docker engine: **dockerd** daemon, interfaces with **containerd**
- **Containerd**: simple daemon, interfaces with **runc** to manage containers; CRUD interface for containers, images, volumes, networks, builds; HTTP API → Google RPC (gRPC) interface;
- **runc**: lightweight command-line tool for running containers; Interfaces with Linux cgroups, namespaces; Runs an OCI container

59

SUPPORT FOR  
ALTERNATE CONTAINER RUNTIMES

- Modularity of Docker implementation supports “execution drivers concept”:
- Enables docker to support many alternate container backends
- OpenVZ, system-nspawn, libvirt-lxc, libvirt-sandbox, qemu/kvm, BSD Jails, Solaris Zones, and chroot

The diagram shows Docker at the top, with a ship icon. Below it are three boxes: 'libcontainer', 'libvirt', and 'lxc'. Arrows point from these boxes to a larger box labeled 'Linux'. Inside the 'Linux' box are several terms: 'cgroups', 'namespaces', 'netlink', 'capabilities', 'selinux', 'netfilter', and 'apparmor'. A penguin icon is at the bottom right of the 'Linux' box.

61

NAMESPACES - 2

Provides isolation of OS entities for containers

mnt: separate filesystems

pid: independent PIDs; first process in container is PID 1

ipc: prevents processes in different IPC namespaces from being able to establish shared memory. Enables processes in different containers to reuse the same identifiers without conflict.

... provides expected VM like isolation...

user: user identification and privilege isolation among separate containers

net: network stack virtualization. Multiple loopbacks (lo)

UTS (UNIX time sharing): provides separate host and domain

OVERLAY FILE SYSTEMS

- Docker leverages overlay filesystems
- 1<sup>st</sup>: AUFS - Advanced multi-layered unification filesystem
- Now: overlay2
- Union mount file system: combine multiple directories into one that appears to contain combined contents
- Idea: Docker uses layered file systems
- Only the top layer is writeable
- Other layers are read-only
- Layers are merged to present the notion of a real file system
- Copy-on-write- implicit sharing
  - Implement duplicate copy
- <https://medium.com/@nagarwal/docker-containers-file-system-demystified-b6ed8112a04a>

## CONTAINER ORCHESTRATION FRAMEWORKS

- Framework(s) to deploy multiple containers
- Provide container clusters using cloud VMs
- Similar to “private clusters”
- Reduce VM idle CPU time in public clouds
- Better leverage “sunk cost” resources
- Compact multiple apps onto shared public cloud infrastructure
- Generate to cost savings
- Reduce vendor lock-in

72

KEY ORCHESTRATION FEATURES

- Management of container hosts
- Launching set of containers
- Rescheduling failed containers
- Linking containers to support workflows
- Providing connectivity to clients outside the container cluster
- Firewall: control network/port accessibility
- Dynamic scaling of containers: horizontal scaling
  - Scale in/out, add/remove containers
- Load balancing over groups of containers
- Rolling upgrades of containers for application

Abstract

Background: This article presents the Container Profiler, a software tool that measures and records the resource usage of any container.

Downloaded from <https://ac>

76

CONTAINER PROFILER

- Captures resource utilization metrics for containers
- Profiles CPU, memory, disk, and network utilization collecting over 60 metrics available from the Linux OS
- Supports two types of profiling
  - **Δ “Delta” Resource Utilization:** Records and calculates total resource utilization from when an initial selection is provided before implementation is verified.
  - **Time series sampling:** supports a configurable sampling interval for continuous monitoring of resources consumed by containers
- Similar profiling techniques compared to SAAF
- Uses Linux proc filesystem “man procs”
- Implemented with a combination of custom code and the Python-based **psutil** library to obtain resource utilization data rapidly

CONTAINER PROFILER:  
PROFILING OVERHEAD

- Profiling overhead (9,000 samples):
- Use case: RNA-sequencing data processing pipeline (*containerized*)
- Hardware: IBM Cloud dual bx2d metal 96 vCPUs processors, 384 GB RAM
  - **Process-level:** 3 peaks indicate different behavior presumably based on the number of processes running inside the containerd cpuldle time.
  - Process level collects and reports all available metrics
- Other Supported Profiling Modes:
  - Container-level profiling
    - Does not collect process-level metrics
    - Faster
  - VM-level profiling:
    - Even faster
    - Only collects host-level metrics

The figure consists of three vertically stacked line graphs, each showing the number of samples collected over time for different profiling levels. The x-axis for all graphs is 'profiling time (ms)' ranging from 0 to 117. The y-axis is 'number of samples' ranging from 0 to 400. Each graph includes a red line representing the 90th percentile of the data.

- Process-level:** Shows three distinct peaks of high sample counts (around 300-400) at approximately 30ms, 60ms, and 90ms.
- Container-level:** Shows two distinct peaks of high sample counts (around 200-300) at approximately 30ms and 60ms.
- VM-level:** Shows one distinct peak of high sample counts (around 200-300) at approximately 30ms.

## CONTAINER PROFILER: PROFILING OVERHEAD EXAMPLE

- 99.95% of process level samples were collected under 100ms
- All container-level samples collected under 74ms
- All host (VM-level) samples collected under 60ms
- UMI RNA-sequencing pipeline use case required 2.5 hours to execute with 1-second sampling at full verbosity (all CPU, network I/O, disk I/O, and memory metrics collected)

```
graph TD
    SI[Sample Interval ΔT] --> P[profiler.sh]
    P --> Docker[docker]
    P --> I[install.sh]
    P --> R[rudataall.py]
    I -- software arguments --> E[execute.sh]
    E -- check if execute.sh is still running --> P
    R --> CS[Continuous Sampling ΔT]
    CS --> RS[Resource Utilization Sample JSON]
    A[Argument] --> P
```

CONTAINER PROFILER:  
METRICS

- Measures up to ~60 metrics
- Configurable Verbosity
- Can rapidly change verbosity

The diagram illustrates the metrics collected by the Container Profiler, organized into four main categories: CPU, Memory, Disk, and Network. Each category has a corresponding icon (CPU chip, RAM, disk, and network card). The metrics are further grouped into sub-categories: Process (pProcesses, cID), Container (pID, pNumProcess), and Host or VM (vID, vLoadAvg). The metrics are color-coded: red for CPU, yellow for Memory, green for Disk, and blue for Network. The metrics include: pNumThreads, pCpuTimeUserMode, pCpuTimeKernelMode, pChildrenUserMode, pChildrenKernelMode, pVoluntaryContextSwitches, pNonvoluntaryContextSwitches, pBlockIODelays, cCpuTime, cProcessorStats, cCpu\$()TIME, cNumProcessors, cCpuTimeUserMode, cCpuTimeKernelMode, cMemoryUsed, cMemoryMaxUsed, cPageFaults, cMemPageFaults, vCpuTime, vCpuTimeUserMode, vCpuTimeKernelMode, vCpuIdleTime, vCpuTimeIOWait, vCpuTimeIntSrv, vCpuTimeSoftIntSrv, vCpuContextSwitches, vCpuNice, vCpuSteal, vCpuType, vCpuMhz, vMemoryTotal, vMemoryFree, vMemoryBuffers, vMemoryCached, vPageFaults, vMemPageFaults, vDiskSectorReads, vDiskSectorWrites, vDiskSuccessfulReads, vDiskMergedReads, vDiskReadTime, vDiskSuccessfulWrites, vDiskMergedWrites, vDiskWriteTime, pVirtualMemoryBytes, pResidentSetSize, pPageFaults, pMemPageFaults, cDiskSectorIO, cDiskReadBytes, cDiskWriteBytes, cNetworkBytesRecv, cNetworkBytesSent, vNetworkBytesRecv, vNetworkBytesSent.

CONTAINER PROFILER:  
USE CASE

- Profiling overhead for jobs profiled by the ContainerProfiler:

The bar chart shows the profiling overhead for different configurations. The x-axis represents the percentage of overhead, ranging from 98.00% to 102.00%. The y-axis lists the configurations: No Profiling, VM, VM + Container, and Full Verbosity. The overhead values are: No Profiling (100.00%), VM (100.07%), VM + Container (100.09%), and Full Verbosity (100.71%).

- Use case: Uniform Molecular Identifier (UMI) RNA-seq pipeline
- Four state: download, split, align, merge
