

# Serverless with Apache OpenWhisk

---

Navid Heydari – TCSS 562

UNIVERSITY *of* WASHINGTON

## Agenda

- > What is **OpenWhisk**?
- > What is **IBM Cloud Function**?
- > **History**
- > **Key Features and Components in OpenWhisk**
- > **Use Case**
- > **Languages Supported in OpenWhisk to write Actions**
- > **Advantages and disadvantages**
- > **Pricing**
- > **CLI and API**
- > **Demo**
- > **References**

UNIVERSITY *of* WASHINGTON

## What is OpenWhisk? IBM Cloud Function?

### > Apache OpenWhisk:

- Open source
- Serverless Computing Framework
- Easier to provisioning
- Focus on **coding** and **functionality** rather than how to expose the functionality.
- Cloud native
- Event Driven
- Focused on **Stateless action Concept**

UNIVERSITY of WASHINGTON

- What is serverless: function/action that could do something rather than focusing on how it can be deployed and how it can be exposed to outside, focus on the logic and the business parts that needs to be solved.
- Cloud native – designed to work in cloud
- Event driven there is built-in functionality and logical process to listen to events → concept of triggers
- NOTE that Serverless NOT a solution for everything and every situation.
- Actions normally will be tried to be stateless, however in case of persistent state, there are some options, like S3 or Redis. In real world application.

## What is IBM Cloud Function?

- > **IBM Cloud Function:**
  - IBM **serverless cloud** env.
  - **Based on Apache OpenWhisk.**

UNIVERSITY of WASHINGTON

- What is serverless: function/action that could do something rather than focusing on how it can be deployed and how it can be exposed to outside, focus on the logic and the business parts that needs to be solved.
- NOTE that Serverless NOT a solution for everything and every situation.
- Actions normally will be tried to be stateless, however in case of persistent state, there are some options, like S3 or Redis. In real world application.

## **History**

---

### **> Who?**

- Apache open source project

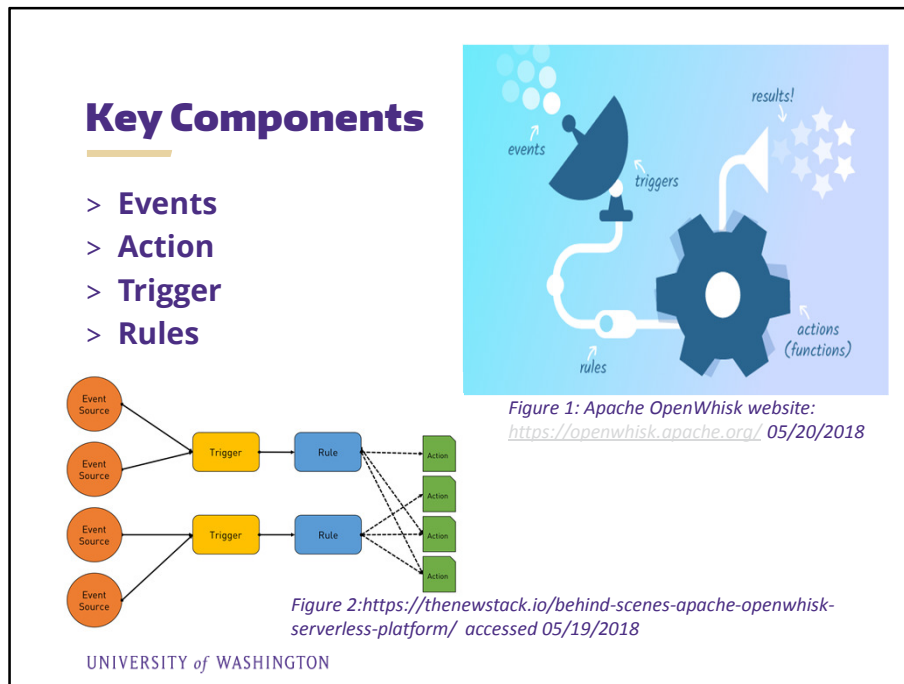

### **> Why?**

- Make it easier for developers
- Event-based
- Cloud native open source environment

### **> How?**

- Based on cloud native and 12 factors
- Few Key components (Next slide)

UNIVERSITY of WASHINGTON

- Action is the **stateless** function that needs to be done
- Trigger (in publisher consumer model and using topic exchange) filled a topic (end points)
- To register an action as a new consumer of a trigger, one creates an OpenWhisk **rule**. (glue between triggers and actions)
- One action can be called by many triggers – loosely coupled.

## **Use Case**

---

- > **There is a RSS feed triggers to enable an action every time new feed is coming, action can capture the URL, sent it to somewhere or log it in S3 or Redis or memCache, and also send a text/email or a message into a slack channel as notification.**

## Advantages and Disadvantages

### > Advantage:

- Light weight
- Fast to develop a deploy
- Packaging concept ( combining Actions under one namespace) `P.with(Mp).a.with(Ma).invoke(P)`
- Externally driven Events listener
- Open Source (Build it locally!)

### > Disadvantage:

- Not a solution for everything
- Still evolving
- Open source (Complex!)
  - > Starting without IBM Cloud will be Challenging

UNIVERSITY of WASHINGTON

Externally driven Events listener

LIKE : RSS feed, Build Tool Trigger messages into Slack Channel

## Languages Supported in OpenWhisk to write Actions

---

Currently, ...

- > **JavaScript**
- > **Swift**
- > **Python**
- > **PHP** function
- > **a Java** method
- > any binary-compatible executable including **Go programs**
- > run any custom code put in a **Docker container**.

UNIVERSITY of WASHINGTON

## IBM Cloud Function for OpenWhisk Pricing

- > **Basic Cloud Functions Rate:**
  - \$0.000017 per second of execution, per GB of memory allocated
- > **API Gateway Rate:**
  - Free/No Limits

UNIVERSITY of WASHINGTON

## Pricing (Cont.) – Cost Example

> Below is showing how much I would be charged for my actions.

**Pricing Calculator**

Basic Rate \$0.000017 GB-s

Avg. Execution Time (in ms) 60

Action Memory (in MB) 256

Executions Per Month 5000

Include Free Tier: (400,000 GB-s free)

Cost Per Month \$0.00

**Examples**

The table below highlights how your action configurations, along with usage, can impact your overall free tier and monthly cost.

| ACTION EXECUTION TIME | ACTION MEMORY | EXECUTIONS PER MONTH | COST PER MONTH |
|-----------------------|---------------|----------------------|----------------|
| 500ms                 | 128MB         | 5,000,000            | Free           |
| 500ms                 | 256MB         | 5,000,000            | \$3.83         |
| 500ms                 | 512MB         | 5,000,000            | \$14.45        |
| 1,000ms               | 128MB         | 10,000,000           | \$14.45        |
| 1,000ms               | 256MB         | 10,000,000           | \$35.70        |
| 1,000ms               | 512MB         | 10,000,000           | \$78.20        |

UNIVERSITY of WASHINGTON

## Communicate with OpenWhisk/ Bluemix

### > Using CLI

- Using **IBM Bluemix** command line tool
- **Bx** wsk **action** create <myActionName>  
<actionFile>

### > Using API

- **Create end points**
- Web Action in Bluemix (**--url** when using create/update action)
  - Explained in demo

UNIVERSITY of WASHINGTON

Through CLI: download and install Bluemix CLI, and use that to create or update actions and invoke them through command line.

# Demo (UI Demo & CI Demo)

---

UNIVERSITY of WASHINGTON
