

TCCS 562: SOFTWARE ENGINEERING FOR CLOUD COMPUTING

Cloud Enabling Technology

Wes J. Lloyd
Institute of Technology
University of Washington - Tacoma

OBJECTIVES

- Cloud Enabling Technology (Ch. 5 Erl book)

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.2

CLOUD ENABLING TECHNOLOGY

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.3

CLOUD ENABLING TECHNOLOGY

- Broadband networks and internet architecture
- Data center technology
- Virtualization technology
- Multitenant technology
- Web/web services technology

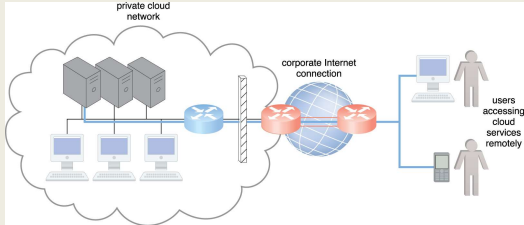

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.4

1. BROADBAND NETWORKS AND INTERNET ARCHITECTURE

- Clouds must be connected to a network
- Inter-networking: Users' network must connect to cloud's network
- Public cloud computing relies heavily on the **Internet**

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.5

PRIVATE CLOUD NETWORKING

private cloud network

corporate Internet connection

users accessing cloud services remotely

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.6

PUBLIC CLOUD NETWORKING

The diagram illustrates the public cloud networking architecture. It shows 'cloud consumers' (represented by server racks and laptops) connected to a 'cloud provider' (represented by a cloud icon with server racks). The connection is established through a 'corporate Internet connection' and a 'cloud provider Internet connection', both leading to a central 'users accessing cloud services remotely' area. The entire network is part of a 'cloud consumer network' and a 'cloud provider network'.

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.7

INTERNETWORKING KEY POINTS

- Cloud consumers and providers typically communicate via the internet
- Decentralized provisioning and management model is not controlled by the cloud consumers or providers
- Inter-networking (internet) relies on connectionless packet switching and route-based interconnectivity
- Routers and switches support communication
- Network bandwidth and latency influence QoS, which is heavily impacted by network congestion

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.8

2. DATA CENTER TECHNOLOGY

- Grouping servers together:
- Enables power sharing
- Higher efficiency in shared IT resource usage (less duplication of effort)
- Improved accessibility and organization

- Key components:
 - Virtualized and physical server resources
 - Standardized, modular hardware
 - Automation support: ease server provisioning, configuration, patching, monitoring without supervision... **tools are desirable**

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.9

CLUSTER MANAGEMENT TOOLS

The screenshot shows a web-based cluster management interface. It features several performance graphs: 'Hyak Cluster Load Last Hour', 'Hyak Cluster Memory Last Hour', 'Hyak Cluster Network Last Hour', and 'Hyak Cluster CPU Last Hour'. There is also a 'Stacked Graph - bal_001' and a 'Hyak Cluster Uptime Last Hour' graph. The interface includes navigation tabs like 'Home', 'Search', 'Reports', and 'Tools'.

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.10

DATA CENTER TECHNOLOGY - KEY COMPONENTS

- Remote operation / management
- **High availability support:** **redundant everything**
 Includes: power supplies, cabling, environmental control systems, communication links, duplicate warm replica hardware
- **Secure design:** physical and logical access control
- **Servers:** rackmount, etc.
- **Storage:** hard disk arrays (RAID), storage area network (SAN): disk array with dedicated network, network attached storage (NAS): disk array on network for NFS, etc.
- **Network hardware:** backbone routers (WAN to LAN connectivity), firewalls, VPN gateways, managed switches/routers

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.11

3. VIRTUALIZATION TECHNOLOGY

- Convert a physical IT resource into a virtual IT resource
- Servers, storage, network, power (virtual UPSs)
- Virtualization supports:
 - Hardware independence
 - Server consolidation
 - Resource replication
 - Resource pooling
 - Elastic scalability
- Virtual servers
 - Operating-system based virtualization
 - Hardware-based virtualization

April 16, 2018 | TCS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma | L6.12

KEY VIRTUALIZATION TRADEOFF

What is the tradeoff space?

Hardware Abstraction

Overhead

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.13

TYPE 1 HYPERVISOR

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.14

TYPE 1 HYPERVISOR

- Acts as a control program
- Miniature OS kernel that manages VMs
- Boots and runs on bare metal
- Also known as Virtual Machine Monitor (VMM)
- Paravirtualization:** Kernel includes I/O drivers
- VM guest OSEs must use special kernel to interoperate
- Kernel traps instructions (i.e. device I/O) to implement sharing & multiplexing
- User mode instructions run directly on the CPU
- Objective:** minimize virtualization overhead
- Classic example is XEN (dom0 kernel)

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.15

COMMON VMMS: PARAVIRTUALIZATION

- XEN
 - Citrix Xen-server (a commercial version of XEN)
 - VMWare ESX (commercial)
 - VMWare ESXi (free)
- Paravirtual I/O drivers introduced
 - KVM
 - Virtualbox

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.16

XEN

- Developed at Cambridge in ~ 2003

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.18

XEN - 2

- VMs managed as "domains"
- Domain 0 is the hypervisor domain
 - Host OS is installed to run on bare-metal, but doesn't directly facilitate virtualization (*unlike KVM*)
- Domains 1..n are guests (VMs) - not bare-metal

```

kentop - 17:53:48 Xen 3.1.2-398.el5
3 domains: 1 running, 2 blocked, 0 paused, 0 crashed, 0 dying, 0 shutdown
Mem: 8379564k total, 8377876k used, 1688k free CPU: 4 @ 2400MHz

```

NAME	STATE	CPU(sec)	CPU(%)	MEM(k)	MEM(%)	MAXMEM(k)	MAXMEM(%)	VCPUS
centos--b---		885	1	0	6313	37119	0	
centos-2--b---		17	0.0	1056640	12.6	2113536	25.2	1
1		50	0	1	3981	541	0	
Domain-0-----r		2979	19.3	6568960	78.4	no limit	n/a	4
4		1057374	290072	0	0	0	0	

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.18

XEN - 3

- Physical machine boots special XEN kernel
- Kernel provides paravirtual API to manage CPU & device multiplexing
- Guests require modified XEN-aware kernels
- Xen supports full-virtualization for unmodified OS guests in hvm mode
- Amazon EC2 largely based on modified version of XEN hypervisor (EC2 gens 1-4)
- XEN provides its own CPU schedulers, I/O scheduling

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.19

TYPE 2 HYPERVISOR

- Adds additional layer

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.20

TYPE 2 HYPERVISOR

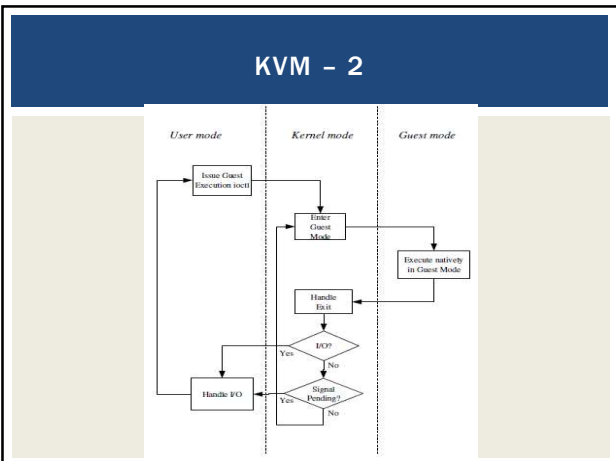

- Problem: Original x86 CPUs could not trap special instructions
- Instructions not specially marked
- Solution: Full Virtualization
- Trap ALL instructions
- "Fully" simulate entire computer
- Tradeoff: Higher Overhead
- Benefit: Can virtualize any operating system without modification

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.21

KERNEL BASED VIRTUAL MACHINES (KVM)

- x86 HW notoriously difficult to virtualize
- Extensions added to 64-bit Intel/AMD CPUs
 - Provides hardware assisted virtualization
 - New "guest" operating mode
 - Hardware state switch
 - Exit reason reporting
 - Intel/AMD implementations different
 - Linux uses vendor specific kernel modules

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.22

KVM - 3

- KVM has /dev/kvm device file node
- Linux character device, with operations:
 - Create new VM
 - Allocate memory to VM
 - Read/write virtual CPU registers
 - Inject interrupts into vCPUs
 - Running vCPUs
- VMs run as Linux processes
- Scheduled by host Linux OS
- Can be pinned to specific cores with "taskset"

April 16, 2018 | TCCS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma | L6.24

KVM PARAVIRTUALIZED I/O

- KVM – Virtio
 - Custom Linux based paravirtual device drivers
 - Supersedes QEMU hardware emulation (full virt.)
 - Based on XEN paravirtualized I/O
 - Custom block device driver provides paravirtual device emulation
 - Virtual bus (memory ring buffer)
 - Requires hypercall facility
 - Direct access to memory

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.25

KVM DIFFERENCES FROM XEN

- KVM requires CPU VMX support
 - Virtualization management extensions
- KVM can virtualize any OS without special kernels
 - Less invasive
- KVM was originally separate from the Linux kernel, but then integrated
- KVM is type 1 hypervisor because the machine boots Linux which has integrated support for virtualization
- Different than XEN because XEN kernel alone is not a full-fledged OS

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.26

KVM ENHANCEMENTS

- Paravirtualized device drivers
 - Virtio
- Guest Symmetric Multiprocessor (SMP) support
 - Leverages multiple on-board CPUs
 - Supported as of Linux 2.6.23
- VM Live Migration
- Linux scheduler integration
 - Optimize scheduler with knowledge that KVM processes are virtual machines

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.27

VIRTUALIZATION MANAGEMENT

- Virtual infrastructure management (VIM) tools
- Tools that manage pools of virtual machines, resources, etc.
- Private cloud software systems can be considered as a VIM
- Considerations:
 - Performance overhead
 - Paravirtualization: custom OS kernels, I/O passed directly to HW w/ special drivers
 - Hardware compatibility for virtualization
 - Portability: virtual resources tend to be difficult to migrate cross-clouds

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.28

VIRTUAL INFRASTRUCTURE MANAGEMENT (VIM)

- Middleware to manage virtual machines and infrastructure of IaaS “clouds”
- Examples
 - OpenNebula
 - Nimbus
 - Eucalyptus
 - OpenStack

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.29

VIM FEATURES

- Create/destroy VM instances
- Image repository
 - Create/Destroy/Update images
 - Image persistence
- Contextualization of VMs
 - Networking address assignment
 - DHCP / Static IPs
 - Manage SSH keys

April 16, 2018 TCCS562: Software Engineering for Cloud Computing [Spring 2018]
Institute of Technology, University of Washington - Tacoma L6.30

VIM FEATURES - 2

- Virtual network configuration/management
 - Public/Private IP address assignment
 - Virtual firewall management
 - Configure/support isolated VLANs (private clusters)
- Support common virtual machine managers (VMMs)
 - XEN, KVM, VMware
 - Support via libvirt library

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.31

VIM FEATURES - 3

- Shared “Elastic” block storage
 - Facility to create/update/delete VM disk volumes
 - Amazon EBS
 - Eucalyptus SC
 - OpenStack Volume Controller

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.32

4. MULTITENANT APPLICATIONS

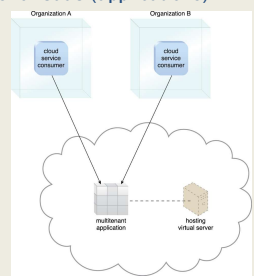

- Each tenant (like in an apartment) has their own view of the application
- Tenants are unaware of their neighbors
- Tenants can only access their data, no access to data and configuration that is not their own
- Customizable features
 - UI, business process, data model, access control
- Application architecture
 - User isolation, data security, recovery/backup by tenant, scalability for a tenant, for tenants, metered usage, data tier isolation

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.33

MULTITENANT APPS - 2

- Forms the basis for SaaS (applications)

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.34

WEB SERVICES/WEB

- Web services technology is a key foundation of cloud computing’s “**as-a-service**” cloud delivery model
- SOAP – “Simple” object access protocol
 - First generation web services
 - WSDL – web services description language
 - UDDI – universal description discovery and integration
 - SOAP services have their own unique interfaces
- REST – instead of defining a custom technical interface REST services are built on the use of HTTP protocol
- HTTP GET, PUT, POST, DELETE

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.35

HYPERTEXT TRANSPORT PROTOCOL (HTTP)

- An ASCII-based request/reply protocol for transferring information on the web
- HTTP request includes:
 - request method (GET, POST, etc.)
 - Uniform Resource Identifier (URI)
 - HTTP protocol version understood by the client
 - headers—extra info regarding transfer request
- HTTP response from server
 - Protocol version & status code →
 - Response headers
 - Response body

HTTP status codes:

2xx — all is well

3xx — resource moved

4xx — access problem

5xx — server error

April 16, 2018
TCSS562: Software Engineering for Cloud Computing [Spring 2018]
 Institute of Technology, University of Washington - Tacoma
L6.36

REST: REPRESENTATIONAL STATE TRANSFER

- Web services protocol
- Supersedes SOAP - Simple Object Access Protocol
- Access and manipulate web resources with a predefined set of stateless operations (known as web services)
- Requests are made to a URI
- Responses are most often in JSON, but can also be HTML, ASCII text, XML, no real limits as long as text-based
- HTTP verbs: GET, POST, PUT, DELETE, ...

REST CLIMATE SERVICES EXAMPLE

- USDA
 - Lat/Long
 - Climate Service Demo
 - Just provide a Lat/Long
- ```
// REST/JSON
// Request climate data for Washington
{
 "parameter": [
 {
 "name": "latitude",
 "value": 47.2529
 },
 {
 "name": "longitude",
 "value": -122.4443
 }
]
}
```

April 16, 2018

TCSS562: Software Engineering for Cloud Computing [Spring 2018]  
 Institute of Technology, University of Washington - Tacoma

L6.41

## REST - 2

- App manipulates one or more types of resources.
- Everything the app does can be characterized as some kind of operation on one or more resources.
- Frequently services are CRUD operations (create/read/update/delete)
  - Create a new resource
  - Read resource(s) matching criterion
  - Update data associated with some resource
  - Destroy a particular a resource
- Resources are often implemented as objects in OO languages

April 16, 2018

TCSS562: Software Engineering for Cloud Computing [Spring 2018]  
 Institute of Technology, University of Washington - Tacoma

L6.42

## REST ARCHITECTURAL ADVANTAGES

- **Performance:** component interactions can be the dominant factor in user-perceived performance and network efficiency
- **Scalability:** to support large numbers of services and interactions among them
- **Simplicity:** of the Uniform Interface
- **Modifiability:** of services to meet changing needs (even while the application is running)
- **Visibility:** of communication between services
- **Portability:** of services by redeployment
- **Reliability:** resists failure at the system level as redundancy of infrastructure is easy to ensure

April 16, 2018 TCSS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma L6.43

## QUESTIONS

April 16, 2018 TCSS562: Software Engineering for Cloud Computing [Spring 2018] Institute of Technology, University of Washington - Tacoma L6.44
