Topic

Discretization of transfer-function models

Overview

consider the discrete-time controller implementation scheme

$$u[k] \longrightarrow \boxed{\mathsf{ZOH}} \xrightarrow{u(t)} \boxed{G(s)} \xrightarrow{y(t)} \circ \xrightarrow{\Delta T} y[k]$$

where u[k] and y[k] have the same sampling time

- for this note, we use [k] to distinguish DT signals from their CT counter parts
- goal: to derive the transfer function from u[k] to y[k]
- solution concept: let u[k] be a discrete-time unit impulse (whose Z transform is 1) and obtain the Z transform of y[k]

Solution

$$u[k] \longrightarrow \overline{\text{ZOH}} \xrightarrow{u(t)} \overline{G(s)} \xrightarrow{y(t)} \circ \xrightarrow{\Delta T} y[k]$$

• u[k] is a DT impulse \Rightarrow after ZOH

$$u(t) = \begin{cases} 1, & 0 \le t < \Delta T \\ 0, & \text{otherwise} \end{cases} = 1(t) - 1(t - \Delta T) \Longrightarrow U(s) = \frac{1 - e^{-s\Delta T}}{s}$$

hence

$$y(t) = \mathcal{L}^{-1}\left[G(s)\frac{1 - e^{-s\Delta T}}{s}\right] = \mathcal{L}^{-1}\left[G(s)\frac{1}{s}\right] - \mathcal{L}^{-1}\left[G(s)\frac{e^{-s\Delta T}}{s}\right]$$

Solution

$$u[k] \xrightarrow{\text{ZOH}} u(t) \xrightarrow{g(s)} g(t) \xrightarrow{\Delta T} y[k]$$
$$y(t) = \mathcal{L}^{-1} \left[G(s) \frac{1}{s} \right] - \mathcal{L}^{-1} \left[G(s) \frac{e^{-s\Delta T}}{s} \right]$$

• sampling y(t) at ΔT and performing Z transform give:

$$\underbrace{\frac{\mathcal{Y}(z)}{\mathcal{L}^{-1}\left[G(s)\frac{1}{s}\right]}_{=G(z)\times 1} - \underbrace{\frac{\tilde{y}(t-\Delta T)}{\mathcal{L}^{-1}\left[G(s)\frac{e^{-s\Delta T}}{s}\right]}_{t=k\Delta T}}_{=\tilde{y}[k-1]!!!}$$

$$= \mathcal{Z}\left\{\mathcal{L}^{-1}\left[G(s)\frac{1}{s}\right]\Big|_{t=k\Delta T}\right\} - z^{-1}\mathcal{Z}\left\{\mathcal{L}^{-1}\left[G(s)\frac{1}{s}\right]\Big|_{t=k\Delta T}\right\}$$

Solution

$$u[k] \longrightarrow \overline{ZOH} \xrightarrow{u(t)} \overline{G(s)} \xrightarrow{y(t)} \circ \xrightarrow{\Delta T} y[k]$$

- $u[k] = \delta[k] (U(z) = 1)$
- $\bullet \ \ Y(z) = \mathcal{Z} \left\{ \left. \mathcal{L}^{-1} \left[\left. G(s) \frac{1}{s} \right] \right|_{t=k\Delta T} \right\} z^{-1} \mathcal{Z} \left\{ \left. \mathcal{L}^{-1} \left[\left. G(s) \frac{1}{s} \right] \right|_{t=k\Delta T} \right\} \right.$
- \Rightarrow the zero order hold equivalent of G(s) is

$$G(z) = (1 - z^{-1})\mathcal{Z}\left\{ \left. \mathcal{L}^{-1} \left[G(s) \frac{1}{s} \right] \right|_{t=k\Delta T} \right\}$$

where ΔT is the sampling time

Example: obtain the ZOH equivalent of

$$G(s) = \frac{a}{s+a}$$

•
$$\frac{G(s)}{s} = \frac{a}{s(s+a)} = \frac{1}{s} - \frac{1}{s+a}$$

hence

$$\mathcal{L}^{-1}\left\{rac{G(s)}{s}
ight\}=1(t)-\mathrm{e}^{-at}1(t)$$

• sampling at ΔT gives $1[k] - e^{-ak\Delta T}1[k]$, whose Z transform is

$$\frac{z}{z-1} - \frac{z}{z - e^{-a\Delta T}} = \frac{z(1 - e^{-a\Delta T})}{(z-1)(z - e^{-a\Delta T})}$$

hence the ZOH equivalent is

$$(1-z^{-1})\frac{z(1-e^{-a\Delta T})}{(z-1)(z-e^{-a\Delta T})} = \frac{1-e^{-a\Delta T}}{z-e^{-a\Delta T}}$$

Matlab and Python commands

```
• e.g., G(s) = \frac{1}{s^2} and \Delta T = 1
% matlab dt = 1; num = 1; den = [1,0,0];
```

```
#Python
import control as ct
dt = 1
num = [1]
den = [1,0,0]
G = ct.tf(num,den)
Gd = ct.c2d(G,dt,'zoh')
print(Gd)
```

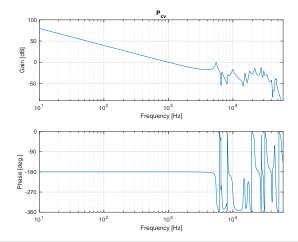

• c2d(G,dt,'zoh')

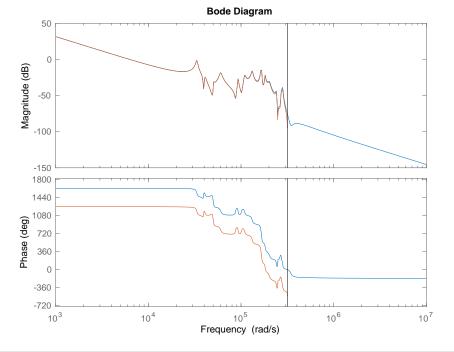

G = tf(num,den);
Gd = c2d(G,dt,'zoh');

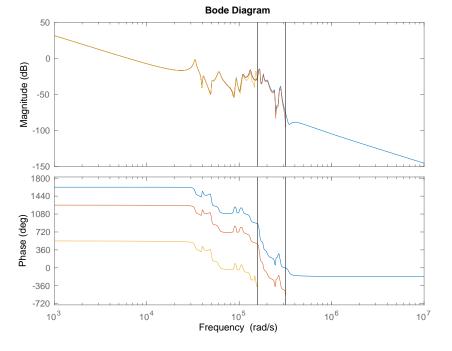

```
% MATLAB code to generate a single-stage HDD model
                                % Number of sector
num sector=420;
num_rpm=7200;
                             % Number of RPM
Ts = 1/(num_rpm/60*num_sector); % Sampling time
omega_vcm=[0, 5300 ,6100 ,6500 ,8050 ,9600 ,14800 ,17400 ,21000 ,26000

```

Exercise

Find the zero order hold equivalent of $G(s) = e^{-Ls}$, $2\Delta T < L < 3\Delta T$, where ΔT is the sampling time.
