# Plan for today

## Plan

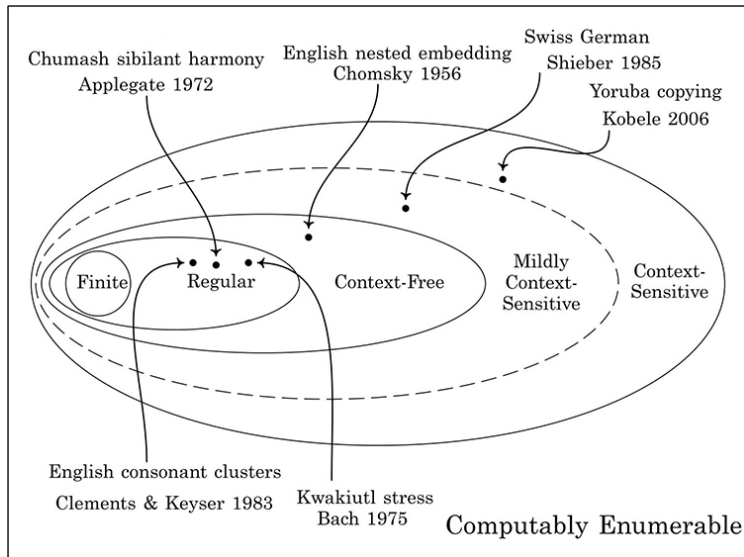

Language Theory

Assignment 1

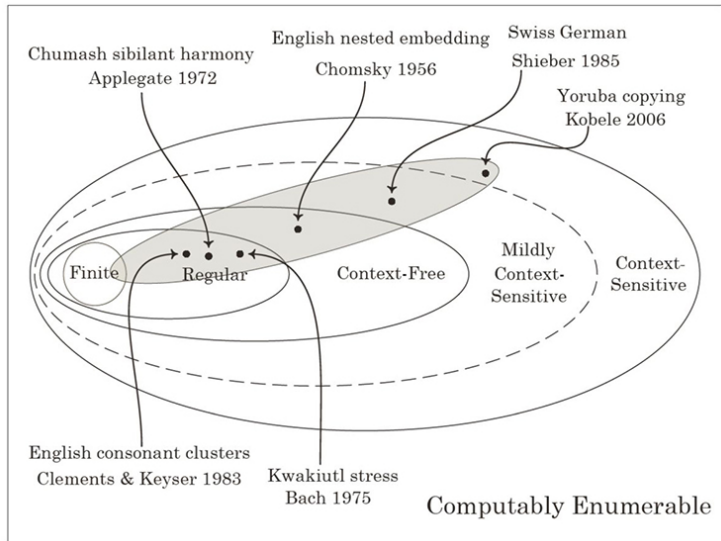

Assignment 2

- ▶ My notes on language theory
- ▶ Assignment 1 final notes
- ▶ Assignment 2 overview

# Language Theory: Why the Chomsky Hierarchy?

# Language Theory: What Does the Learner Need to Learn?

# Difficulties, Complaints, and Questions

- ▶ Introductory programming
  - ▶ I have no idea what to do with this tool/program!!!
- ▶ Introductory linguistics
  - ▶ The assignment is unclear!!!
- ▶ Why is intro to programming not a prerequisite?
- ▶ Why is basic programming worth learning?
- ▶ Can't you just give us the full list of sentences/words our program is supposed to handle?

# My advice

- ▶ Work in a **systematic** manner
- ▶ Analyse the tasks into small components
- ▶ Make sure you understand each component separately before combining things

# My advice

- ▶ Work in a **systematic** manner
- ▶ Analyse the tasks into small components
- ▶ Make sure you understand each component separately before combining things
- ▶ Example: What does this line of code mean?
  - ▶ `str = re.sub(pattern,replacement,str)`

# My advice

- ▶ Work in a **systematic** manner
- ▶ Analyse the tasks into small components
- ▶ Make sure you understand each component separately before combining things
- ▶ Example: What does this line of code mean?
  - ▶ `str = re.sub(pattern, replacement, str)`
  - ▶ Look up variables, assignment, functions, arguments
  - ▶ Look up `re.sub()` definition in python3 docs
  - ▶ Debug your program step by step
  - ▶ Pay attention to the program state

# My advice

- ▶ Work in a **systematic** manner
- ▶ Analyse the tasks into small components
- ▶ Make sure you understand each component separately before combining things
- ▶ Example: What does this line of code mean?
  - ▶ `str = re.sub(pattern, replacement, str)`
  - ▶ Look up variables, assignment, functions, arguments
  - ▶ Look up `re.sub()` definition in python3 docs
  - ▶ Debug your program step by step
  - ▶ Pay attention to the program state
- ▶ Example: What does the ask mean?
  - ▶ *“sentences.txt must include the subject-verb agreement paradigm of the verb “to be” in 1st and 2nd person”*

- ▶ Work in a **systematic** manner
- ▶ Analyse the tasks into small components
- ▶ Make sure you understand each component separately before combining things
- ▶ Example: What does this line of code mean?
  - ▶ `str = re.sub(pattern, replacement, str)`
  - ▶ Look up variables, assignment, functions, arguments
  - ▶ Look up `re.sub()` definition in python3 docs
  - ▶ Debug your program step by step
  - ▶ Pay attention to the program state
- ▶ Example: What does the ask mean?
  - ▶ *“sentences.txt must include the subject-verb agreement paradigm of the verb “to be” in 1st and 2nd person”*
  - ▶ Look up subject-verb agreement in a linguistics text
  - ▶ Get access to the full paradigm in e.g. ESL materials
  - ▶ Define and/or cite things in your write up

# Debugging the program

- ▶ Shown in the section video from April 3, starting at about minute 34

# Assignment 2

- ▶ Excellent tutorial, do read (a few times if necessary)
- ▶ Technical component
  - ▶ Entirely in command line
    - ▶ visualization of FSA possible using a program called “graphviz” (not required)
  - ▶ No python
  - ▶ A special language/formalism called “foma”
  - ▶ The off-the-shelf program “foma” which understands that language/formalism
- ▶ Linguistic component
  - ▶ Basic (but fairly extensive!) morphology; phonology
  - ▶ Linguistic description of an unfamiliar language

# Working on patas (if you have Windows)

- ▶ Connect to patas via ssh
- ▶ Type `/opt/foma/bin/foma`
- ▶ (This is also in your instructions for Assign.2)
- ▶ To exit: `Ctrl+D`
- ▶ Note that you can still edit your files locally and copy them to patas to run `foma` on them

# Working locally (recommended for OSX/linux)

- ▶ Install foma following the instructions for Assign.2
- ▶ Copy the file “foma” into your `/usr/local/bin`
  - ▶ In terminal, from the directory where you put the new files: `cp foma /usr/local/bin/`

# foma example

- ▶ example.lexc and example.foma
- ▶ Representing a trivial example with English morphology and phonology
  - ▶ The tutorial has another, more complete one
- ▶ Files are available to you on Canvas/Files
- ▶ Start with the lexc file (morphology)
- ▶ Start foma, read the lexicon FSA in, examine the output (pairs)
  - ▶ How do I read the lexicon FSA in???
- ▶ Continue with the foma file (phonology)
- ▶ if you have graphviz, try view
  - ▶ graphviz may or may not install on your machine
  - ▶ get it from their website rather than pip
