## 1. Course Information

### 1.1 Syllabus

UH 8:00-10:05 ADMC GWP 101
SLN 19294 C
Lecturer: Ruth Vanderpool
Office Hours: U 10:05-10:35am
Phone: 253-692-4310

H 10:05-10:35am
e-mail: rvanderp@u.washington.edu
Webpage: http://faculty.washington.edu/rvanderp/index.html
Core: The Core program consists of a coordinated series of courses that represent the various disciplines in the university. This course, along with the others in your cohort, fulfills one of the university's general education requirements in each of the areas of knowledge plus composition. The courses are designed to both support and challenge you to develop the critical thinking, writing, research, and analytical skills you'll need at UWT while introducing you to relevant topics in the social sciences, humanities, and sciences.

Course Description \& Student Learning Objectives: This course is primarily focused on introducing scientific thinking using geometry, art, and the history of math \& sciences. Content and general skills will be developed.
Students will be able to:

1. define origami \& provide some history of its development.
2. solve open-ended geometric problems involving lines, triangles, and circles.
3. express geometric ideas to others through precise writing or speech.

More generally, by the end of this course students will have the skills to:

1. express ideas clearly in writing and speaking in order to synthesize and evaluate information.
2. identify, analyze, and summarize/represent the key elements of a text.
3. self-assess personal strengths and how they help overcome weaknesses.
4. approach a complex issue by breaking it down into manageable pieces.
5. make connections among assignments and readings to develop a sense of the "big picture".
6. collect, evaluate, and analyze information to solve problems or answer questions.

## Required Items:

- Lang, Robert. Origami Design Secrets: Mathematical Methods for an Ancient Art 2nd Ed. ISBN: 978-1-56-881436-0
- Wheater, Carolyn. Practice Makes Perfect Geometry ISBN: 978-0-07-163814-2

## Important Dates:

4/30 Midterm $\quad 4 / 7$ Last day to alter your schedule with no fees
6/11 Final @ 8:00am 5/19 Last day to change your grading option

## Journals:

You will keep a journal for this class. Journal assignments and questions will be assigned during each class and you are expected to complete the journal work by the next session. You are welcome to put additional thoughts and work in the journal, but keep the assignments in order and at the start of each new journal assignment write the date it was assigned. Bring the journals to class everyday so that they can help inform our discussions.

I will regularly collect the journals every Tuesday at the start of class and return them before class ends. When collected, the entire journal must be turned in and not just the newest entries. The journal must be kept separate from any course notes in either its own binder or bound book. The material will never be formally graded, but the entries are marked for completion.

## Homework:

Homework will be assigned everyday and collected regularly. Ten minutes will be set aside at the start of every class to address homework questions. Assignments are due by 8:00am (the start of class) the day they are due. Once I have started marking an assignment, I no longer accept late work.

The homework will be largely comprised of worksheets write-ups and origami work. Given the Student Learning Objectives described above, your work will be largely graded by the process, explanation, in addition to the correctness. Because of this, you will have to spend more time on your homework than you would on a more traditional, computationbased math course.

Quizzes:
A quiz is given every week at the instructor's discretion. Generally you will be given 30 minutes following the homework question period at the start of class every Tuesday. The quizzes will focus on the material covered in the previous week. No notes or books may be used, but calculators and patty paper are allowed. No make up quizzes, unless previously arranged, will be given, but I drop the lowest scoring quiz to give you some flexibility.

## Paper \& Projects:

1. One 2-page research paper: Details, including the grading rubric and time table will be provided by week five.
2. One group origami project: Where you and a partner find, present, and help the class fold an origami design. The detailed instructions will be handed out by the end of week two but you may want to start searching for a pattern that you find enjoyable and can teach others.

Grades: The following weights will be used to calculate your grade.

| Journals | $15 \%$ |
| :--- | :--- |
| Homework | $20 \%$ |
| Quizzes | $15 \%$ |
| Paper \& Projects | $15 \%$ |
| Midterm | $15 \%$ |
| Final | $20 \%$ |

The above grade assignment is based off the University of Washington, Tacoma's grading scale posted at http://www.tacoma.washington.edu/enrollmentservices/grading.cfm.

## Outside Resources:

Come visit me if you have questions! If you are unable to attend my posted office hours but would like to meet, please let me know. I am willing to try and work with your schedule. Also remember that you are not alone in this class and your peers are a valuable (and often underutilized) resource.

The Teaching \& Learning Center (TLC) is offering a number of additional instructional services that can help with writing and quantitative material. Complete information and hours are posted at: http://www.tacoma.washington.edu/tlc/. Also, don't forget about all the resources you learned about in the Fall during Core Lab!

## Notes:

- I do not check my email after 4 pm . Any questions sent to my email after 4 pm may not receive a response until the next morning. The University's e-mail policy is posted at: http://www.tacoma.washington.edu/policies_procedures/E-mail_Policy.pdf
- Electronic devices should not be used during class. Activities that are non-relevant to the course, such as checking/sending email, playing games, and surfing the web, are considered disruptive activities when class is in session.
- Don't cheat and don't plagiarize. To plagiarize is to appropriate and to pass off, as one's own ideas, writing or works of another. Ignorance of proper documentation procedures is the usual cause of plagiarism. This ignorance does not excuse the act. Students are responsible for learning how and when to document and attribute resources used in preparing a written or oral presentation. For more information, please refer to the Academic Honesty: Cheating and Plagiarism document prepared by the Committee on Academic Conduct in the College of Arts and Sciences, UW Seattle: http://depts.washington.edu/grading/issue1/honesty.htm
- The University of Washington Tacoma is committed to making physical facilities and instructional programs accessible to students with disabilities. Disability Support Services (DSS) functions as the focal point for coordination of services for students with disabilities. In compliance with Title II of the Americans with Disabilities Act, any enrolled student at UW Tacoma who has an appropriately documented physical, emotional, or mental disability that "substantially limits one or more major life activities [including walking, seeing, hearing, speaking, breathing, learning, and working]," is eligible for services from DSS. If you are wondering if you may be eligible for accommodations on our campus, please contact the DSS reception desk at 692-4522. A complete description of services provided is posted at: http://www.tacoma.washington.edu/studentaffairs/SHW/dss_about.cfm
- Complete safety information and emergency procedures is available at http://www.tacoma.washington.edu/security.
The highlights are as follows:
- In case of fire, take your valuables, leave the building, and report to the parking lot next to the Library and across the street from the Mattress factory. Plan to return to class once the alarm has stopped.
- In case of an earthquake, DROP, COVER, and HOLD. Once the shaking stops, take your valuables, leave the building, and report to the parking lot next to the Library and across the street from the Mattress factory. Do not plan to return for the rest of the day.

In both of the above cases, do not return until you have received an all clear from somebody "official," the web, or email.

- The Counseling Center offers short-term, problem-focused counseling to UW Tacoma students who may feel overwhelmed by the responsibilities of college, work, family, and relationships. Counselors are available to help students cope with stresses and personal issues that may interfere with their ability to perform in school. The service is provided confidentially and without additional charge to currently enrolled undergraduate and graduate students. To schedule an appointment, please call 692-4522 or stop by the Student Counseling Center (SCC), located in MAT 253.
- While I have attempted to make this syllabus as complete as possible, adjustments will be made throughout the course. Announcements will be made during class and it is the responsibility of the student to keep updated if class is missed.

### 1.2 Schedule (tentative)

| Week 1 | 2:Origami: Butterfly <br> TED talk \& Class Orientation <br> Math: Lines \& Angles <br> Wks: Patty 1 | 4: Discussion: What is science? <br> Technical Writing Example <br> Math: Logic <br> Wks: Patty 2 <br> Due: Patty Wks 1 |
| :---: | :---: | :---: |
| Week 2 | 9: Quiz <br> Discussion: Math anxiety <br> Math: $\\| \& \perp$ Lines <br> Wks: Patty 3 <br> Due: Journals \& Patty Wks 2 | 11: <br> Origami Project Discussion <br> Math: $\triangle$ Properties <br> Wks: Patty 4 <br> Due: Patty Wks 3 |
| Week 3 | 16: Quiz <br> Three Origami Presentations <br> History: Ancient Mathematicians <br> Due: Journals, Presentations, \& Patty Wks 4 | 18: <br> Four Origami Presentations <br> Due: Project 1 Draft |
| Week 4 | 23: Quiz <br> Peer Eval: Directions <br> Origami: Bases <br> Start Fighter jet folding <br> Due: Journals, Elephant Head Directions | 25: <br> Origami: identify bases <br> History: Origami $1 / 2$ of Between the Folds Movie Due: Project 1 Due |
| Week 5 | 30: Midterm <br> handout: Project 2 Specifications <br> Due: Journals | 2: Discuss definition of science <br> Math: Pythagorean Theorem. <br> Wks: Patty 5 <br> Due: Fighter jet or snail |
| Week 6 | 7:Guest: Librarian <br> Origami: Valentine or Hummingbird <br> Due: Journals, draft valentine or hummingbird | 9:Math: trigonometry Origami: Valentine or Hummingbird |
| Week 7 | 14: Quiz <br> Project 2 draft exchange <br> Math: Yoshizawa split <br> Due: Journals, Project 2 draft | 16:History: Mathematics 1800-1900's <br> Math: Spherical Geometry <br> Wks: Patty 7 |
| Week 8 | 21: Guest Lecture on Kirigami by Daniel Heath from Pacific Lutheran University Due: Project 2, 60\&36 angle-a-tron | 23: Guest Lecture on Papercraft <br> by James Moore <br> from UWT <br> Due: $60 \& 36$ angle-a-tron instructions, Wks 7 |
| Week 9 | 28: <br> History: Gödel \& NPR Story | 30: Discussion: definition of origami $1 / 2$ of Between the Folds Movie |
| Week 10 | $\begin{aligned} & \hline 4: \\ & \text { DAT } \end{aligned}$ | 6 Course Evaluations Answer Questions |

## 2. Review

### 2.1 Algebra Review

I generally assume proficiency in the skills listed below.

## Basic Simplification

Apply order of operations to numerical and algebraic expressions; recall the rules for exponents.
Ex 1. Perform the operations: $\frac{3}{5}+2$

$$
\begin{aligned}
& \text { Solution: } \\
& \frac{3}{5}+\frac{2}{1}=\frac{3}{5}+\frac{2}{1} \cdot \frac{5}{5}=\frac{3}{5}+\frac{10}{5}=\frac{13}{5}
\end{aligned}
$$

(Another answer is 2.4.)
Ex 2. Simplify: $\sqrt{5} \cdot \sqrt{5}+2$
Solution:

$$
\sqrt{5} \cdot \sqrt{5}+2=5+2=7
$$

Ex 3. Simplify: $\sqrt{\frac{4}{25}}$
Solution:

$$
\sqrt{\frac{4}{25}}=\frac{\sqrt{4}}{\sqrt{25}}=\frac{2}{5}
$$

Ex 4. Simplify: $-3^{2}+\left(\frac{3}{2}\right)^{2}+(-2)^{3}$.
Solution:

$$
-3^{2}+\left(\frac{3}{2}\right)^{2}+(-2)^{3}=-9+\frac{9}{4}+-8=-17+\frac{9}{4}=\frac{-68}{4}+\frac{9}{4}=\frac{-59}{4}
$$

(Another answer is $-14.75 .-14 \frac{3}{4}$ is also technically correct, but you should avoid mixed fractions because of potential confusion: Taken out of context, $-14 \frac{3}{4}$ could mean either $-\left(14+\frac{3}{4}\right)$ or $(-14) \cdot \frac{3}{4}$.)

## Algebraic Manipulation

Add, subtract, multiply, and divide algebraic expressions; combine algebraic terms that are alike; apply the distributive property to algebraic expressions (the term "FOIL" only refers to distribution between two binomials; ask me to show you why FOIL works if you don't remember).
Ex 5 Solve for $x$ : $\frac{3}{x}=\frac{1}{6}$.
Solution:
Multiply both sides by $x$ : $x \cdot \frac{3}{x}=\frac{1}{6} \cdot x \Rightarrow 3=\frac{x}{6}$.
Multiply both sides by $6: 6 \cdot 3=\frac{x}{6} \cdot 6 \Rightarrow 18=x$.
Both of these steps done at the same time is often called "cross multiplication".

Ex 6 Simplify by combining like terms: $\left(9 x^{2}+4 x y-7 y^{2}\right)-\left(5 x y-6 x^{2}-1\right)$.
Solution:

$$
\left(9 x^{2}+4 x y-7 y^{2}\right)-\left(5 x y-6 x^{2}-1\right)=9 x^{2}+4 x y-7 y^{2}-5 x y+6 x^{2}+1=15 x^{2}-x y-7 y^{2}+1
$$

Ex 7 Expand and simplify completely: $3(4 v-2 a)^{2}$.
Solution:

$$
\begin{aligned}
3(4 v-2 a)^{2}=3(4 v-2 a) \cdot(4 v-2 a)=3[(4 v) & (4 v)-(4 v)(2 a)-(2 a)(4 v)+(2 a)(2 a)] \\
& =3\left[16 v^{2}-16 a v+4 a^{2}\right]=48 v^{2}-48 a v+12 a^{2}
\end{aligned}
$$

## Rational Expressions

Simplify fractions by finding factors in common; add/subtract fractions by first rewriting with the least common denominator; multiply/divide rational expressions; simplify complex fractions.

Ex 9 Reduce to lowest terms: $\frac{10 x-20}{2 x^{2}-8}$.

$$
\begin{aligned}
& \text { Solution: } \\
& \frac{10 x-20}{2 x^{2}-8}=\frac{10(x-2)}{2\left(x^{2}-4\right)}=\frac{10(x-2)}{2(x+2)(x-2)}=\frac{2(x-2)}{2(x-2)} \cdot \frac{5}{x+2}=\frac{5}{x+2}
\end{aligned}
$$

Ex 8 Perform the indicated operations and simplify: $\frac{2}{3 x+2}-\frac{1}{3 x+1}$.

$$
\begin{aligned}
& \begin{array}{l}
\frac{\text { Solution: }}{3 x+2}-\frac{1}{3 x+1}=\frac{3 x+1}{3 x+1} \cdot \frac{2}{3 x+2}-\frac{1}{3 x+1} \cdot \frac{3 x+2}{3 x+2} \\
\end{array} \begin{array}{r}
=\frac{6 x+2}{(3 x+1)(3 x+2)}-\frac{3 x+2}{(3 x+1)(3 x+2)}=\frac{3 x}{(3 x+1)(3 x+2)}
\end{array}
\end{aligned}
$$

(There is no further simplification here, $3 x$ has no factors in common with $3 x+1$ or $3 x+2$.)
Ex 9 Perform the indicated operations and simplify: $\frac{2 z+6}{12 z} \div \frac{z^{2}-9}{9 z^{3}+18 z^{2}}$.

$$
\begin{aligned}
& \begin{array}{l}
\frac{\text { Solution: }}{12 z} \div \frac{z^{2}-9}{9 z^{3}+18 z^{2}}=\frac{2 z+6}{12 z} \cdot \frac{9 z^{3}+18 z^{2}}{z^{2}-9}=
\end{array} \begin{aligned}
& \frac{2(z+3)}{12 z} \frac{9 z^{2}(z+2)}{(z+3)(z-3)} \\
&=\frac{2 \cdot 3 \cdot z(z+3)}{2 \cdot 3 \cdot z(z+3)} \cdot \frac{3 z(z+2)}{2(z-3)}=\frac{3 z(z+2)}{2(z-3)}
\end{aligned}
\end{aligned}
$$

## Solving Equations

Solve linear equations; or solve for two unknowns when given two equations.
Ex 10 Solve for $m: 3(m+4)+2 m=4-3 m$.
Solution

$$
3(m+4)+2 m=4-3 m \Rightarrow 3 m+12+2 m=4-3 m \Rightarrow 8 m=-8 \Rightarrow m=-1
$$

Ex 11 Solve for $q$ when $q+7=9 p$ and $\frac{2}{p}=2 q$.

## 3. Patty Paper Worksheets

Welcome to geometric investigations with patty paper!
Patty paper is a thin wax paper commonly used between uncooked hamburger patties. They are conveniently cut into 5.5 " or 6 " squares which is useful to have during origami practice or for geometric investigations.

## Patty Paper Rules

Just as video games, car drivers, and people in general have rules that must be respected, our geometric investigations are going to have a set of rules. A few years ago most geometry classes would only let students use a compass and straightedge (no rulers or protractors!). The calculus classes on campus will let students use rulers, protractors, and calculators but no graphing calculators. Every class and in particular, every math class, is usually explicit about what tools the students are allowed to use in order to solve problems, that is, they lay out the 'rules'.

In this class we will have the patty paper game rules:
You are allowed to use:

1. lots of patty paper (notice that they are semi-translucent and stackable!),
2. the assumption that the patty paper is a square,
3. a pencil (or pen, colored pencil, crayons, etc),
4. a calculator (of any kind),
5. your senses (seeing, hearing, feeling, etc), and
6. logic.

Explicitly that means you are not allowed to use: an already made ruler or an already made protractor.

Despite these restrictions you will be able to complete many tasks. For example, while distances can't be measured, we can make a record of it by making marks on the paper. With this record of distance we can compare distances to each other to determine which is longer or if they are the same length. As the investigations go on you will discover your own methods and should build your own 'tool set' of techniques.

The worksheets are designed to be started in class and finished as part of your homework. These problems are intentionally non-standard so that you can practice scientific thinking when working on them (SLO content \#2, skills \#4 \&6) and then develop technical communication skills when writing your solutions (SLO content \#3, skills \#1). Your finished worksheet should be easy to read with complete sentences, correct grammar, and precise language. You will need to reread, edit, and rewrite your solutions and should not be turning in a first draft.

### 3.1 Patty Paper Worksheet 1

## Vertical Angles

inspired by Michael Serra's Patty Paper Geometry.

1. Fold a line on a patty paper. Unfold.

Fold a second line intersecting the first line. Unfold.
2. Notice there are four angles surrounding the intersection of the two lines. Label them $a, b, c$, and $d$ so that you can refer to each by name.
3. Are any angles the same? Are all the angles different?

4. Explain carefully what steps you took so that you could compare one angle to another. Consider drawing pictures if that helps clarify your steps.
5. Repeat steps 1 and 2 and see if the observations you made in Step 3 still apply to a different pair of lines. If your conclusion in Step 3, does not hold in general (that is for any pair of intersecting lines that make angles $a, b, c$, and $d$ ), correct Step 3 so that it is true in general.

6. The pairs of opposite angles formed by two intersecting lines are called vertical angles. For example, in the diagram to the right, $\angle a$ and $\angle c$ are a pair of vertical angles. Restate your conclusions in 3 using this new terminology.
7. Two angles that have a common vertex, share a side, and do not overlap are adjacent angles. For example, $\angle a$ and $\angle b$ in the diagram on the bottom of the front page, are adjacent angles. Can you say anything about sum of the pairs of adjacent angles above?
8. Two angles whose measures add up to $180^{\circ}$ are called supplementary angles. Are all adjacent angles also supplementary? Either justify yourself of provide a counter example.

Use your conclusions on the front page of this worksheet and any other geometric knowledge to calculate the measure of each lettered angles in the questions below.

9. Origami directions usually start with a square piece of paper, but $8.5 " \times 11^{\prime \prime}$ paper is more commonly available today. How can you determine what amount to cut off of a rectangular $8.5 " \times 11 "$ (remember the rules! no rulers!) to make a square? Give the steps below (you may want another sheet of paper if you need more room) and then justify that your steps guarantee a square.

### 3.2 Patty Paper Worksheet 2

## Folding TUPs

inspired by Kazuo Haga's "Folding Paper and Enjoy Math: Origamics" in Origami: Third International Meeting of Origami Science, Mathematics, and Education.

1. Take a piece of patty paper and label the lower right-hand corner $A$. Pick a random point on the paper and label that point $B$.
2. Fold the paper so that $A$ lies on top of $B$. This creates a flap of paper, called the Turned-Up Part (or TUP for short).

3. [1] How many edges does your TUP have? Three? Four? Five?

For instance, in the example depicted above, the TUP has three sides.
4. [7] Experiment with many TUPs to find an answer to the question, "How can we tell how many edges a TUP will have before we even fold the paper?"
5. [7] What if we allowed the point $B$ to be outside the square? "How can we tell how many edges a TUP will have before we even fold the paper?"

### 3.3 Patty Paper Worksheet 3

# Angles \& Parallel Lines 

inspired by Michael Serra's Patty Paper Geometry.

1. Trace the pair of parallel lines shown on the right, onto a patty paper.
2. Fold or draw a transversal line.

Label the angles as shown in the diagram
 so that you can refer to each by name.
3. [1] Do any angles have the same measure? Which ones? (Write a complete list.)
4. [3] Explain carefully what steps you took so that you could compare one angle to another. Consider drawing pictures if that helps clarify your steps.

5. Repeat steps 1 through 3 with a different pair of parallel lines (another set is provided on the right if you are not sure how to manufacture your own) and see if the observations you make in Step 3 still apply. If your conclusion in Step 3, does not hold in general (that is for any set of parallel lines intersected by a transversal), correct Step 3 so that it is true in general.

6. [2] Recall the definition of corresponding angles provided in class. Restate and, if necessary, expand your statement in Step 3 so that you use this term.
7. [2] Assume you are given a set of lines with a transversal. If the corresponding angles have the same measure, explain why the alternating interior angles must have the same measure.
8. [2] Restate and, if necessary, expand your statement in Step 3 that that you use the terms alternating interior angles and alternating exterior angles.
9. [1] Your statement in Step 6 should be written as a conditional statement. Identify the hypothesis and the conclusion.
10. [1] Write the converse of your statement in Step 6.
11. [3] Is that statement in Step 10 true? If true, provide some justification, if false, provide a counterexample.

### 3.4 Patty Paper Worksheet 4

## Making Parallel \& Perpendicular Lines

inspired by Michael Serra's Patty Paper Geometry.

1. Fold a line on a patty paper. Unfold. Mark this line $l$.
2. Discover a method for making a line that is perpendicular to $l$. Remember that this is a patty paper investigation so stick to the patty paper rules!
3. Make another line on your patty paper and follow your process developed in Step 2 to make a perpendicular line to this new one. If the process you developed in Step 2 does not work, create a new process that will work for any line on the patty paper.
4. [4] Discover a method for making a line that is parallel to $l$. Make sure that your process works for any line on your patty paper, and then describe your process. Justify why your method works.
5. Use your pencil to make a point not on the line $l$. Discover a method for folding a line through the point so that it is parallel to the line $l$. Compare your method with other groups and, if different, determine which method you like better.
6. [5] Describe your favorite process of making a line parallel to a given line $l$ that also runs through a specified point.

## Sum of Angles in a Triangle

1. Draw a triangle on your patty paper near the center and identify the vertices $A, B$, and $C$.
2. Use the method described on the front of this worksheet to make a line parallel to $A C$ that also passes through $B$. Label the points where this new line intersects with the edges of the patty paper as $X$ and $Y$, as shown.

3. [1] There should be at least five angles on your patty paper now. Are any of the angles on the patty paper are the same? If so, mark them.
4. Repeat Steps 1 and 2 with a different triangle to see if the observations you made in Step 3 still apply. If your statements in Step 3 does not hold in general (for any $\triangle A B C$ and line parallel to $\overline{A C}$ ), correct Step 3.
5. [2] The $\angle X B Y$ is a straight line and thus measures $180^{\circ}$, but it is also equal to the sum three other angles. What three angles make up $\angle X B Y$ ?
6. [3] Use Step 5 and your observations made in Step 3 to justify that the sum of angles in a triangle is $180^{\circ}$.

### 3.5 Patty Paper Worksheet 5

## Haga's Theorem

inspired by Kazuo Haga's "Folding Paper and Enjoy Math: Origamics" in Origami: Third International Meeting of Origami Science, Mathematics, and Education.

1. Take a patty paper and mark a point $P$ at random along the top edge of the paper.
2. Fold the lower right corner to the point $P$ as depicted.

3. Notice that there are (usually) three triangles that are formed by the fold you made in step two. Label the triangles $A, B$, and $C$ as done above.
4. [7] What nice relationship must be true about triangles $A, B$, and $C$ ? Justify your conclusions.
5. [8] Suppose that you took the point $P$ to be the midpoint of the top edge. Use your above observation (or generate more observations) to find out what lengths $x, y$, and $z$ must
 be in the figure to the right.

### 3.6 Patty Paper Worksheet 6

## The Largest Equilateral Triangle

inspired by Thomas Hull's "What's the biggest Equilateral Triangle in a Square" in Project Origami, activities for exploring mathematics.

1. [3] First fold you square to produce a $30^{\circ}-60^{\circ}-90^{\circ}$ triangle inside it. Explain your method and justify that you made a $30^{\circ}-60^{\circ}-90^{\circ}$ triangle. Hint: these special triangles have the property that the hypothenuse is twice as long as one of its sides.
2. [3] Find a way to fold an equilateral triangle inside a patty paper. Explain your method and justify that you made an equilateral triangle.
3. [1] If the side length of your original square is 1 , conjecture if it is possible for you to make an equilateral triangle who's side length is greater than 1 ?
4. [3] If an equilateral triangle is maximal (the equilateral triangle is the largest equilateral triangle that will fit on a patty paper), can we assume that one of its vertices will coincide with a vertex of the patty paper? Why? Could we say anything about the other vertices of the equilateral triangle?
5. [1] Draw a picture of the situation in question 4 where the patty paper shares the lower left vertex with the maximal equilateral triangle.
6. [4] Let $\theta$ denote the angle between the bottom of the square and the bottom of the triangle. What angle should $\theta$ be to maximize the size of the equilateral triangle in the patty paper? Justify your conclusion. Hint: consider symmetry!

### 3.7 Patty Paper Worksheet 7

## Spherical Geometry

In addition to the normal patty paper rules, assume that you have a perfect sphere.

1. Explain in your own words what a geodesic is.
2. Answer each of the following:

How many geodesic paths are between two points in a plane?

How many geodesic paths are between the 'north pole' \& 'south pole' on a sphere?
3. [3] You have already come up with methods to make a geodesic perpendicular to a given one on a plane (think Worksheet 4). Find a (patty paper) technique to make a geodesic perpendicular a given one on the sphere. Explain your steps and justify how you know your constructed geodesic is perpendicular.
4. [2] You have already come up with methods to make a geodesic parallel to a given one on a plane (think Worksheet 4 again). Can you find a technique to make a geodesic parallel to a given one on the sphere? Justify your answer.
5. [2] Answer each of the following:

How many times do two perpendicular geodesics intersect in the plane?

If two geodesics are perpendicular on a plane, how many $90^{\circ}$ angles are made?

How many times to two perpendicular geodesics intersect on the sphere?

If two geodesics are perpendicular on a sphere, how many $90^{\circ}$ angles are made?

Recall that I defined a triangle in class as figure with three sides. On a plane we understand 'side' to mean line, but really, we should think of 'side' as a geodesic. Thus, a triangle is a figure made from three geodesics.
6. [4] Can you make a right triangle on the sphere? If so, explain how, and if not, explain why you can't.
7. [2] Can you make a right triangle on the sphere with more than one $90^{\circ}$ angle? If so, draw a picture of it, and if not, explain why you can't
8. [2] Can you make a rectangle on the sphere? If so, draw a picture of it, and if not, explain why you can't

## 4. Origami Patterns

## 4.1

## Butterfly

A design that probably started with work by the Japanese master Akira Yoshizawa, this model uses the folding sequence of the multiform base to form the wings. You can make different-shaped lower wings by altering the folds made in step 4. Try to choose paper that looks like a real butterfly and see if you can fold it smaller and smaller until it is the same size as a real butterfly.

## MULTIFORM BASE REMINDER

1 Start with a square, white side up. Fold in half from side to side and top to bottom, crease, then unfold.

2 Crease both diagonals.

3 Turn the paper over and fold each corner to the center. Crease and unfold. Turn the paper back over.

4 Fold each edge to the center. Crease and unfold.

5 Use the creases indicated to collapse the paper-no new creases are needed.

6 Collapse the lower section to match the top.

7 The completed multiform base (see page 31).

Robinson Nick. 2008. Picture-perfect Origami. New York: St. Martin's Griffin.

### 4.2 Bases (classic)

Kite Base

Fish Base
Made available through Wikibooks.org under the wikimedia commons or GNU free documentation.

Frog Base
From: Honda, Isao.1965. The World of Origami. Tokyo: Japan Publications Trading Company.

### 4.3 Bases (other)

Preliminary Fold
Available under the wikimedia commons through Wikibooks.org.

### 4.4 Balloon

## 72. Balloon

The balloon base is an origami that Japanese children learn in kindergarten. With it we can make a number of interesting folds.
Use a six-inch square of paper.

1. Prepare the paper by book folding it in half. Valley fold on the dotted line.
2. Open the square into a triangle by peak and valley folding as indicated.
3. Repeat step 2 on the underside.
4. Valley fold the top folds on the dotted lines, bringing the bottom edges up to the center line.
5. Turn the model over and repeat.
6. Valley fold the right and left points into the center line. Turn the model over and repeat.
7. Valley fold points A and B down into the pockets shown.
8. Repeat with points C and D.
9. Peak and valley fold as shown to flatten out the top and bottom of the cube shape..
10. Blow air into the indicated hole.
11. The finished balloon.

### 4.5 Penguin

## 5. Other Worksheets

### 5.1 Computing Grades

1. Clark Kent goes to college and on the first day of precalculus class he is handed the following information on the syllabus:

## Grades:

The following weights will be used to calculate your percentage in the course. The function graphed takes your percentage in the course and returns your grade on a 4. scale.

|  |  |  | ${ }_{4}$ Course | e Crade |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 5\% |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Mini-Quizzes (top score) | 5\% |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| WeBWork assignments | 10\% |  | . |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Handwritten assignments | 15\% |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Quizzes | 15\% |  | 2 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 Midterms | 30\% |  | , |  |  |  | 146 |  |  |  |  |  |  |  |  |  |
| Final | 25\% |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  | 50 |  |  | \% |  |  |  | ${ }^{\circ} 1000$ |

In week 7 Clark begins to get concerned about his grades (being a super hero is still new to him so he has missed a few assignments and a test). He logs onto Catalyst and finds the following information:
Mini-Quiz: (ea. worth 10 pts$) 9.5$
WebWork: (ea. worth 10pts) $10 \begin{array}{llllllllll}10 & 10 & 10 & 10 & 10 & 10 & 10 & 10 & 10\end{array}$
Written HW: (ea. worth 10pts)
Quizzes:
(percentage)
10

2 Exams (percentage) 920
(a) Compute Clark's current averages for each of the categories below:
Mini-Quiz
Quizzes
WeBWork
WrittenHW
2 Exams
(b) Assuming his performance in each category will not change in the remaining weeks, what grade must Clark get on his final to get a 2.5 in the class?
2. Lois Lane goes to college and on the first day of origami math class is handed the following information on the syllabus:

Grades: The following weights will be used to calculate your grade.

The above grade assignment is based off the University of Washington, Tacoma's grading scale posted at http://www.tacoma.washington.edu/enrollmentservices/grading.cfm.
In week 7 Lois begins to get concerned about her grades. She logs onto Catalyst and finds the following information:

| Journals: | (ea. worth 10pts) | 10 | 10 | 10 | 7 | 10 | 10 | 10 | 10 | 10 | 10 |
| :--- | :--- | :--- | :--- | :--- | :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| Homework: | (ea. worth 15pts) | 15 | 11 | 10 | 12 | 10 | 15 | 15 | 11 |  |  |
| Quizzes: | (ea. worth 20pts) | 18 | 13 | 17 | 13 |  |  |  |  |  |  |
| Origami Proj. | (ea. worth 40pts) | 37 |  |  |  |  |  |  |  |  |  |
| Midterm: | (percentage) | 82 |  |  |  |  |  |  |  |  |  |

Recall that the lowest scoring quiz is dropped when computing grades. Assuming her journal, homework, quiz, and origami project averages do not change much in the remaining weeks, what scores could Lois Lane get on her papers and final to make sure she gets a 2.0 in the class?

## 6. Readings

### 6.1 Quotes

Geometry, throughout the $17^{\text {th }}$ and $18^{\text {th }}$ centuries, remained, in the war against empiricism, an impregnable fortress of the idealists. Those who held ... that certain knowledge, independent of experience, was possible about the real world, had only to point to Geometry: none but a madman, they said would throw doubt on its validity, and none but a fool would deny its objective reference.

## -Bertrand Russell

I have never done anything 'useful'. No discovery of mine has made, or is likely to make, directly or indirectly, for good or ill, the least difference to the amenity of the world.
-G.H. Hardy
From this proposition it will follow, when arithmetical addition has been defined, that

$$
1+1=2 .
$$

-Principia Mathematica
A.N. Whitehead \& B. Russell

Euclidean Axioms:

1. We can draw a straight line from any point to any other point.
2. We can extend a finite straight line continuously into a straight line.
3. We can completely describe a circle by specifying the center and distance [radius].
4. All right angles are equal to one another.
5. Given a point not on a straight line $l$, at most one line can be drawn through this point that never meets $l$.
-Elements
Euclid
[Euclidean geometry] was rigorous and definite. Sure theorems about lines and triangles, circles and squares, following with unimpeachable logic from clearly stated assumptions ... [it] remained unchanged for more than a hundred years.
-Pi in the Sky
John Barrow

## Origami Axioms:

1. Given two points $p_{1}$ and $p_{2}$, there is a unique fold that passes through both $p_{1}$ and $p_{2}$.
2. Given two points $p_{1}$ and $p_{2}$, there is a unique fold that places $p_{1}$ onto $p_{2}$.
3. Given two lines $l_{1}$ and $l_{2}$, there is a fold that places $l_{1}$ onto $l_{2}$.
4. Given a point $p_{1}$ and a line $l_{1}$, there is a unique fold perpendicular to $l_{1}$ that passes through point $p_{1}$.
5. Given two points $p_{1}$ and $p_{2}$ and a line $l_{1}$, there is a fold that places $p_{1}$ onto $l_{1}$ and passes through $p_{2}$.
6. Given two points $p_{1}$ and $p_{2}$ and two lines $l_{1}$ and $l_{2}$, there is a fold that places $p_{1}$ onto $l_{1}$ and $p_{2}$ onto $l_{2}$.
7. Given one point $p$ and two lines $l_{1}$ and $l_{2}$, there is a fold that places $p$ onto $l_{1}$ and is perpendicular to $l_{2}$.

### 6.2 Technical Communication

# Technical Communication Today <br> THIRD EDITION 

## Richard Johnson-Sheehan

Purdue University

Longman
New York San Francisco Boston
London Toronto Sydney Tokyo Singapore Madrid Mexico City Munich Paris Cape Town Hong Kong Montreal

## 'Rechnical Communication: Actions, Words, Images

If yeu are a college student, much of your writing experience until now has probably lweet rxpository in nature. The root word for expository is "exposition," meaning you have been taught to display or exhibit information. Primarily, you have been taught Inow to demonstrate that you have acquired and retained knowledge on specific subjects. Your readers have mostly been teachers and professors.

Technical communication is different from expository writing, because it puts more forus on taking action with words and images. It focuses more on achieving a specific purpose with language. It also puts a much heavier emphasis on anticipating the needs of the readers and communicating information clearly and persuasively:-
Figure 1.2 shows some of the characteristics of technical communication that can set it apart from expository writing.

Fortunately, the skills you learned for expository writing are all adaptable to technical communication. The main difference is that technical communication puts a much greater emphasis on achieving a specific purpose with words and images.

## The Qualities of Technical Communication

Figure 1.2:
Technical communicatic puts much mi emphasis on managing information a taking action do most othe forms of writi

Genres do much more than help you organize your ideas. They help you interpret and make sense of what is happening in the technical workplace. For example, if you know you need to write an analytical report, the genre will help you figure out what kind of information you need to collect, how that information should be arranged, and how it should be presented. Your readers. meanwhile, will interpret your ideas through the genre. If you call something a "report," they will have specific expectations about the content, organization, style, design, and medium of the document.

Genres are not formulas or recipes to be followed mechanically. They are not containers into which we pour some sentences and paragraphs. Instead, genres in technical communication reflect the activities and practices of scientific and technical workplaces. Each genre should be adapted to fit the readers and the situations in which the document will be used.

## Genres and the Technical Writing Process

A consistent writing process is important to using technical communication genres effectively. When learning to write for the workplace, you should view writing as a process that follows a series of stages (Figure 2.2). These stages include the following:

Figure 2.2:
The technical writing process involves moving back and forth among several stages. Each stage is shaped by the genre of the document.

## Two Different Genres

## Genres in Technical Communication

In this book. you will be learning a genre-based approuch to the writing process. In lechnical communication. genres are relatively stable patterns that reflect the activities and practices of the workplace. A genre shapes a document's content, organization, style, design, and the medium in which it is delivered. It also helps you anticipate the needs of your readers and the situations in which they will use your text.

For example, an"analytical report" is a different genre than a "specification"(Figure 2.1). Inalytical reports and specifications are written for different kinds of readers and situations. They include different information and follow their own organizational patterns. The style and design of these two genres are distinctly different. Yet, someone working in a lechnical workplace would need to know how to use both of these genres.

Figure 2.1: Each genre has its own content, organization. style, and design.
Here are the outlines of two distinctly different genres set side by side.

Analytical Report

Specification

Condestors

## 1

IIire than likely. you have read and used countless sets of instructions in sour lifetime. Instructions are packaged with the products we buy. such as phones. cameras, and televisions. In the technical work place. documentation hetps people complete simple and complex tasks. such as downoading software. building an airplane engine. drawing blood lrom a patient. and asoembling a computer motherboard.

Instructions and other kinds of documentation are among the least noticed but most important documents in the techaical workplace. Three types of documentation are commonty written and used in this arena:

Instructions-lantaction dexcribe how to perform a pereine tavk. They typiaily describe how to asemble a product or do womething step-low-atep.
Specifications-Enginere and terdmicians write epecifications often catled the"-quece") to dereribe in exact detail bow a product is assembled or how a routine proces is completed.
Procedures/Protocols - Procedures and protecols are written to ensure consistency and guality in a workplace. In hoeppitals, for example. doctors and nurses are oftern asked to write procedures that describe how to handle emergency siluations or care for a specific injury or illness. Similarly. sciontists will use protocols to ennure comsi-tent methods in the laborator:

## Unt

for mere infor. (1hifion on writing lescriptions. go lo Chapter 19. page 530.

## Basic Organization

To avoid confusion in this chapter, the word documentation will be used as general term to mean instructions, procedures, and specifications. When the chapter discusses issues that are specific to instructions, procedures, or specifira tions, those terms will be used.

## Basic Features of Documentation

Documentation tends to follow a consistent step-by-step pattern. whether you are describing how to make coffee or how to assemble an automobile engine (Figure 20, 1)

I lere are the basic features of most forms of documentation:

- specific and precise title
- introduction with background information
- list of materials, parts, tools, and conditions required

## Sequentially Ordered Steps

The steps are the centerpiece of any form of documentation, and they will usually make up the bulk of the text. These steps need to be presented logically and concisely, allowing readers to easily understand them and complete the task.

 ace wary hazard tatements or additional comments that might be induded.

Once you have organzed the task into major and minor heps. you are ready to drall your instractions.

Use command voicesteps houh be written in ammand whit or imperative mool. To nee command vice, start (ach step will an ation verl).
:. Place the telescope in an upright position on a flat surface.
2. Plug the coil cord for the Electronic Controller into the HBX port see Figure 5

## Using Logical Mapping to Identify Steps in a Task

In most steps, the verb should come first in the sentence. This puts the action up front, while keeping the pattern of the steps consistent. The "you" in these sentences is not stated, but rather implied ("You place the telescope in an upright position").

ST.ITE ONE ICION PER STEP Each step should express only one action (Figure 20.9). You might be tempted to state two smaller actions in one step, but your readers will appreciate following each step separately.

## Ineffective

2. Place the telescope securely on its side as shown in Figure 4 and open the battery compartment by simultaneously depressing the two release latches.

## Revised

2. Place the telescope securely on its side as shown in Figure 4.
3. Open the battery compartment by simultaneously depressing the two release latches.

However, when two actions must be completed at the same time, you should put them in the same sentence.
6. Insert a low-power eyepiece (e.g., 26 mm ) into the eyepiece holder and tighten the eyepiece thumbscrew.

Instructions with Sequentially Ordered Steps

10．2．1．3 Put on coveralls．

In vercifications. comments and hazard statements receive a number. The purpose Ior this advanced numbering scheme is to make items in the documentation easier to reference.

In some cases, you may also want to use paragraph style to describe the steps (Figure 20.10). In these situations, you can use headings or sequential transitions to

Paragraph Style Instructions

Source: Husqvarna.
highlight the vepp. Xumerical tramsilions ("first.""surond."-third."-Finally") are bew in most cases. In shorter sets of steps. you might use transitions like "then." "next."- ; minutes hater:"and "hinaly" to mark the ations. In Figure ? (0) I ( ) headings are used to mark transilions among the major steps.

Readers often find paragraph style harder to follow because they cannot easily find their place again in the list of instructions. In some cases. though, paragraph style takes up less space and sounds more friendly and conversational.

- State one action per step.
- Keep the steps concise.
- Number the steps.
- Add comments. notes, or examples.
- Provide feedback.

Refer to the graphics.
(i)I) (OMIVEXTS. NOTES OR FXIMPIFS . Ifter each step, you can include additional comments or examples that will help readers complete the action. Comments after steps might include additional advice or definitions for less experienced readers. Or. comments might provide troubleshooting advice in case the step did not work out.

## 3. Locate a place to set your telescope.

Finding a suitable place to set up your telescope can be tricky. A paved area is optimal to keep the telescope steady. If a paved area is not available, find a level place where you can firmhy set your telescope's tripod in the soil.

Comments and examples are often written in the "you" style to maintain a positive tone.

PROVIDE FEFEDIBICK After a difficult step or group of steps, you might offer a paragraph of feedback to help readers assess their progress.

When you finish these steps, the barrel of your telescope should be pointed straight up. The tripod should be stable so that it does not teeter when touched. The legs of the tripod should be planted firmly on the ground.

REFER TOTIIE GR.IPIICS In the steps, refer readers to any accompanying graphics. A simple statement like, "See Figure 4" or "(Figure 4)" will notify readers that a graphic is available that illustrates the step. After reading the step, they can look at the graphic for help in completing the step properly.

In some cases, graphics are not labeled. In these situations, the graphic should appear immediately next to the step or below it so readers know which visual goes with each step.

## Revising, Editing, and Proofreading

In many ways, the documentation reflects the quality of the product, service, and manufacturer. If the documentation looks unprofessional or has errors, readers will doubt the quality of the company behind it. So, you should leave yourself plenty of time for revising, editing, and proofreading. Also, leave yourself some time to user-test your documentation on some real readers.

## Revising for Content, Style, and Design

When you are finished drafting, spend time critically studying the document's content, style, and design.

- The content needs to be complete and include all the information readers need to complete the task. Look for places where steps are missing or unclear. Identify steps that would be clearer with a follow-up note or comment. Identify plaees where-hazard-statements-are-needed
- The style should be concise and clear. Keep sentences, especially commands, short and to the point. Where possible, replace complex words with simpler, plainer terms. Meanwhile, use words that reflect readers' attitudes or emotions as they will be using your documentation.
- The design should enhance readers' ability to follow the steps. Make sure you have used headings, notes, and graphics consistently. The page layout should also be consistent from the first page to the last.
As you revise, ask yourself whether the content, style, and design are appropriate for the readers you defined in your reader profile. Your documentation should be usable by the least experienced, least knowledgeable person among your readers.

## User-Testing with Sample Readers

User-testing your documentation on actual people can be done informally or formally, as discussed in Chapter 12 of this book

- Informal user-testing can be used for in-house or less important forms of documentation. You should ask at least your supervisor or a few co-workers to look over your documentation before making it available to others. Often, your colleagues can help you identify missing content, ambiguous sentences, and ineffective graphics.
- Formal user-testing involves finding real users of the documentation and observing them as they try to follow the steps. Often, formal user-testing includes videotaping the subjects as they use the documentation.

## Editing and Proofreading

Finatly, you should carefully edit and proofread your documentation. The text should be clearly written and error free. whether the document is being sent with a product. included in a book of procedures. or placed in the specifications file.

Gou should challenge the comtent. organization, style, and design. Be your own harshest eritic. Then, while proofreading, pay close attention to grammar and -pelling. Flawless documentation will strengthen your readers faith in you and your company:

- Downmendalion describes step-by-step how to complete a task.
- Banic leatures of documentation include a specific and precise tille: an introduction: a list of parts, tools. and conditions required: sequentially ordered steps: graphics: salety information: a conchasion: and troubleshooting information.
- Determine the rhetorical situation by asking the Fire- 11 and I low Questions and analyaing the document's subject, purpose. readers, and context of use.
- Organize and draft your documentation step-bỵ-step. breaking tasks down into Heeir major and minor actions.
- Safety information should (1) identify the hazard. ('2) state the level of risk (I) inger. Warning, or Caution) and (3) offer suggestions for avoiding injury or clamage.
- The style of your documentation does not need to be dry and boring. Try to use a style that reflects or counters readers altitudes as they follow the steps.
- Graphics offer important support for the written text. They shouk be properly labeled by mumber and inserted on the page where they are relerenced.
- While revising, nser-testing your documentation with sample readers is an effective Way to work out any bugs and locate places for improvement. bour obserations of these sample readers should help gou revise the document.

## Individual or Team Projects

1. Find an example of documentation in your home or workplace. l'sing concepts discused in this chapter, develop a set ol criteria to evaluate its content. organization. style. and design. Then, write a two-page memo to your instructor in Which you analyze the documentation. I lighlight any strengths and make suggestions for improvements.
2. In your home or workplace. find an inelfective set of instructions. First, identify its weaknesses in content. orgamization. style, and design. Then, revise the instructions (o) make them easier to use. Write a cover memo to your instructor in which you discuss the ways you revised and improved the set of instructions.
3. Turn the instructions for playing Klondike at the end of this chapter into a numbered list and use graphics to support the text. You can make minor changes to the wording of the text: however. try to heep) the written text intact as much as possible.
4. ( In the fnternet or in your home, find information on lirst aid chandling choking, treating injuries. using CPR. handling drowning. treating shock, dealing with aleohol or drug owerdoses). Then. turn this information into a text that is specifically amed at college students living on campus. lou should keep in mind that these

### 6.3 A Mathematician's Lament

A Mathematician's Lament<br>by Paul Lockhart

Amusician wakes from a terrible nightmare. In his dream he finds himself in a society where music education has been made mandatory. "We are helping our students become more competitive in an increasingly sound-filled world." Educators, school systems, and the state are put in charge of this vital project. Studies are commissioned, committees are formed, and decisions are made - all without the advice or participation of a single working musician or composer.

Since musicians are known to set down their ideas in the form of sheet music, these curious black dots and lines must constitute the "language of music." It is imperative that students become fluent in this language if they are to attain any degree of musical competence; indeed, it would be ludicrous to expect a child to sing a song or play an instrument without having a thorough grounding in music notation and theory. Playing and listening to music, let alone composing an original piece, are considered very advanced topics and are generally put off until college, and more often graduate school.

As for the primary and secondary schools, their mission is to train students to use this language - to jiggle symbols around according to a fixed set of rules: "Music class is where we take out our staff paper, our teacher puts some notes on the board, and we copy them or transpose them into a different key. We have to make sure to get the clefs and key signatures right, and our teacher is very picky about making sure we fill in our quarter-notes completely. One time we had a chromatic scale problem and I did it right, but the teacher gave me no credit because I had the stems pointing the wrong way."

In their wisdom, educators soon realize that even very young children can be given this kind of musical instruction. In fact it is considered quite shameful if one's third-grader hasn't completely memorized his circle of fifths. "I'll have to get my son a music tutor. He simply won't apply himself to his music homework. He says it's boring. He just sits there staring out the window, humming tunes to himself and making up silly songs."

In the higher grades the pressure is really on. After all, the students must be prepared for the standardized tests and college admissions exams. Students must take courses in Scales and Modes, Meter, Harmony, and Counterpoint. "It's a lot for them to learn, but later in college when they finally get to hear all this stuff, they'll really appreciate all the work they did in high school." Of course, not many students actually go on to concentrate in music, so only a few will ever get to hear the sounds that the black dots represent. Nevertheless, it is important that every member of society be able to recognize a modulation or a fugal passage, regardless of the fact that they will never hear one. "To tell you the truth, most students just aren't very good at music. They are bored in class, their skills are terrible, and their homework is barely legible. Most of them couldn't care less about how important music is in today's world; they just want to take the minimum number of music courses and be done with it. I guess there are just music people and non-music people. I had this one kid, though, man was she sensational! Her sheets were impeccable - every note in the right place, perfect calligraphy, sharps, flats, just beautiful. She's going to make one hell of a musician someday."

Waking up in a cold sweat, the musician realizes, gratefully, that it was all just a crazy dream. "Of course!" he reassures himself, "No society would ever reduce such a beautiful and meaningful art form to something so mindless and trivial; no culture could be so cruel to its children as to deprive them of such a natural, satisfying means of human expression. How absurd!"

Meanwhile, on the other side of town, a painter has just awakened from a similar nightmare...

I was surprised to find myself in a regular school classroom - no easels, no tubes of paint. "Oh we don't actually apply paint until high school," I was told by the students. "In seventh grade we mostly study colors and applicators." They showed me a worksheet. On one side were swatches of color with blank spaces next to them. They were told to write in the names. "I like painting," one of them remarked, "they tell me what to do and I do it. It's easy!"

After class I spoke with the teacher. "So your students don't actually do any painting?" I asked. "Well, next year they take Pre-Paint-by-Numbers. That prepares them for the main Paint-by-Numbers sequence in high school. So they'll get to use what they've learned here and apply it to real-life painting situations - dipping the brush into paint, wiping it off, stuff like that. Of course we track our students by ability. The really excellent painters - the ones who know their colors and brushes backwards and forwards - they get to the actual painting a little sooner, and some of them even take the Advanced Placement classes for college credit. But mostly we're just trying to give these kids a good foundation in what painting is all about, so when they get out there in the real world and paint their kitchen they don't make a total mess of it."
"Um, these high school classes you mentioned..."
"You mean Paint-by-Numbers? We're seeing much higher enrollments lately. I think it's mostly coming from parents wanting to make sure their kid gets into a good college. Nothing looks better than Advanced Paint-by-Numbers on a high school transcript."
"Why do colleges care if you can fill in numbered regions with the corresponding color?"
"Oh, well, you know, it shows clear-headed logical thinking. And of course if a student is planning to major in one of the visual sciences, like fashion or interior decorating, then it's really a good idea to get your painting requirements out of the way in high school."
"I see. And when do students get to paint freely, on a blank canvas?"
"You sound like one of my professors! They were always going on about expressing yourself and your feelings and things like that-really way-out-there abstract stuff. I've got a degree in Painting myself, but I've never really worked much with blank canvasses. I just use the Paint-by-Numbers kits supplied by the school board."

Sadly, our present system of mathematics education is precisely this kind of nightmare. In fact, if I had to design a mechanism for the express purpose of destroying a child's natural curiosity and love of pattern-making, I couldn't possibly do as good a job as is currently being done- I simply wouldn't have the imagination to come up with the kind of senseless, soulcrushing ideas that constitute contemporary mathematics education.

Everyone knows that something is wrong. The politicians say, "we need higher standards." The schools say, "we need more money and equipment." Educators say one thing, and teachers
say another. They are all wrong. The only people who understand what is going on are the ones most often blamed and least often heard: the students. They say, "math class is stupid and boring," and they are right.

## Mathematics and Culture

The first thing to understand is that mathematics is an art. The difference between math and the other arts, such as music and painting, is that our culture does not recognize it as such. Everyone understands that poets, painters, and musicians create works of art, and are expressing themselves in word, image, and sound. In fact, our society is rather generous when it comes to creative expression; architects, chefs, and even television directors are considered to be working artists. So why not mathematicians?

Part of the problem is that nobody has the faintest idea what it is that mathematicians do. The common perception seems to be that mathematicians are somehow connected with science- perhaps they help the scientists with their formulas, or feed big numbers into computers for some reason or other. There is no question that if the world had to be divided into the "poetic dreamers" and the "rational thinkers" most people would place mathematicians in the latter category.

Nevertheless, the fact is that there is nothing as dreamy and poetic, nothing as radical, subversive, and psychedelic, as mathematics. It is every bit as mind blowing as cosmology or physics (mathematicians conceived of black holes long before astronomers actually found any), and allows more freedom of expression than poetry, art, or music (which depend heavily on properties of the physical universe). Mathematics is the purest of the arts, as well as the most misunderstood.

So let me try to explain what mathematics is, and what mathematicians do. I can hardly do better than to begin with G.H. Hardy's excellent description:

A mathematician, like a painter or poet, is a maker of patterns. If his patterns are more permanent than theirs, it is because they are made with ideas.

So mathematicians sit around making patterns of ideas. What sort of patterns? What sort of ideas? Ideas about the rhinoceros? No, those we leave to the biologists. Ideas about language and culture? No, not usually. These things are all far too complicated for most mathematicians' taste. If there is anything like a unifying aesthetic principle in mathematics, it is this: simple is beautifil. Mathematicians enjoy thinking about the simplest possible things, and the simplest possible things are imaginary.

For example, if I'm in the mood to think about shapes - and I often am - I might imagine a triangle inside a rectangular box:

I wonder how much of the box the triangle takes up? Two-thirds maybe? The important thing to understand is that I'm not talking about this drawing of a triangle in a box. Nor am I talking about some metal triangle forming part of a girder system for a bridge. There's no ulterior practical purpose here. I'm just playing. That's what math is- wondering, playing, amusing yourself with your imagination. For one thing, the question of how much of the box the triangle takes up doesn't even make any sense for real, physical objects. Even the most carefully made physical triangle is still a hopelessly complicated collection of jiggling atoms; it changes its size from one minute to the next. That is, unless you want to talk about some sort of approximate measurements. Well, that's where the aesthetic comes in. That's just not simple, and consequently it is an ugly question which depends on all sorts of real-world details. Let's leave that to the scientists. The mathematical question is about an imaginary triangle inside an imaginary box. The edges are perfect because I want them to be- that is the sort of object I prefer to think about. This is a major theme in mathematics: things are what you want them to be. You have endless choices; there is no reality to get in your way.

On the other hand, once you have made your choices (for example I might choose to make my triangle symmetrical, or not) then your new creations do what they do, whether you like it or not. This is the amazing thing about making imaginary patterns: they talk back! The triangle takes up a certain amount of its box, and I don't have any control over what that amount is. There is a number out there, maybe it's two-thirds, maybe it isn't, but I don't get to say what it is. I have to find out what it is.

So we get to play and imagine whatever we want and make patterns and ask questions about them. But how do we answer these questions? It's not at all like science. There's no experiment I can do with test tubes and equipment and whatnot that will tell me the truth about a figment of my imagination. The only way to get at the truth about our imaginations is to use our imaginations, and that is hard work.

In the case of the triangle in its box, I do see something simple and pretty:

If I chop the rectangle into two pieces like this, I can see that each piece is cut diagonally in half by the sides of the triangle. So there is just as much space inside the triangle as outside. That means that the triangle must take up exactly half the box!

This is what a piece of mathematics looks and feels like. That little narrative is an example of the mathematician's art: asking simple and elegant questions about our imaginary creations, and crafting satisfying and beautiful explanations. There is really nothing else quite like this realm of pure idea; it's fascinating, it's fun, and it's free!

Now where did this idea of mine come from? How did I know to draw that line? How does a painter know where to put his brush? Inspiration, experience, trial and error, dumb luck. That's the art of it, creating these beautiful little poems of thought, these sonnets of pure reason. There is something so wonderfully transformational about this art form. The relationship between the triangle and the rectangle was a mystery, and then that one little line made it
obvious. I couldn't see, and then all of a sudden I could. Somehow, I was able to create a profound simple beauty out of nothing, and change myself in the process. Isn't that what art is all about?

This is why it is so heartbreaking to see what is being done to mathematics in school. This rich and fascinating adventure of the imagination has been reduced to a sterile set of "facts" to be memorized and procedures to be followed. In place of a simple and natural question about shapes, and a creative and rewarding process of invention and discovery, students are treated to this:

## Triangle Area Formula:

$$
A=1 / 2 b h
$$

"The area of a triangle is equal to one-half its base times its height." Students are asked to memorize this formula and then "apply" it over and over in the "exercises." Gone is the thrill, the joy, even the pain and frustration of the creative act. There is not even a problem anymore. The question has been asked and answered at the same time - there is nothing left for the student to do.

Now let me be clear about what I'm objecting to. It's not about formulas, or memorizing interesting facts. That's fine in context, and has its place just as learning a vocabulary does - it helps you to create richer, more nuanced works of art. But it's not the fact that triangles take up half their box that matters. What matters is the beautiful idea of chopping it with the line, and how that might inspire other beautiful ideas and lead to creative breakthroughs in other problems - something a mere statement of fact can never give you.

By removing the creative process and leaving only the results of that process, you virtually guarantee that no one will have any real engagement with the subject. It is like saying that Michelangelo created a beautiful sculpture, without letting me see it. How am I supposed to be inspired by that? (And of course it's actually much worse than this- at least it's understood that there is an art of sculpture that I am being prevented from appreciating).

By concentrating on what, and leaving out why, mathematics is reduced to an empty shell. The art is not in the "truth" but in the explanation, the argument. It is the argument itself which gives the truth its context, and determines what is really being said and meant. Mathematics is the art of explanation. If you deny students the opportunity to engage in this activity - to pose their own problems, make their own conjectures and discoveries, to be wrong, to be creatively frustrated, to have an inspiration, and to cobble together their own explanations and proofs-you deny them mathematics itself. So no, I'm not complaining about the presence of facts and formulas in our mathematics classes, I'm complaining about the lack of mathematics in our mathematics classes.

Tf your art teacher were to tell you that painting is all about filling in numbered regions, you I would know that something was wrong. The culture informs you - there are museums and galleries, as well as the art in your own home. Painting is well understood by society as a
medium of human expression. Likewise, if your science teacher tried to convince you that astronomy is about predicting a person's future based on their date of birth, you would know she was crazy - science has seeped into the culture to such an extent that almost everyone knows about atoms and galaxies and laws of nature. But if your math teacher gives you the impression, either expressly or by default, that mathematics is about formulas and definitions and memorizing algorithms, who will set you straight?

The cultural problem is a self-perpetuating monster: students learn about math from their teachers, and teachers learn about it from their teachers, so this lack of understanding and appreciation for mathematics in our culture replicates itself indefinitely. Worse, the perpetuation of this "pseudo-mathematics," this emphasis on the accurate yet mindless manipulation of symbols, creates its own culture and its own set of values. Those who have become adept at it derive a great deal of self-esteem from their success. The last thing they want to hear is that math is really about raw creativity and aesthetic sensitivity. Many a graduate student has come to grief when they discover, after a decade of being told they were "good at math," that in fact they have no real mathematical talent and are just very good at following directions. Math is not about following directions, it's about making new directions.

And I haven't even mentioned the lack of mathematical criticism in school. At no time are students let in on the secret that mathematics, like any literature, is created by human beings for their own amusement; that works of mathematics are subject to critical appraisal; that one can have and develop mathematical taste. A piece of mathematics is like a poem, and we can ask if it satisfies our aesthetic criteria: Is this argument sound? Does it make sense? Is it simple and elegant? Does it get me closer to the heart of the matter? Of course there's no criticism going on in school - there's no art being done to criticize!

Why don't we want our children to learn to do mathematics? Is it that we don't trust them, that we think it's too hard? We seem to feel that they are capable of making arguments and coming to their own conclusions about Napoleon, why not about triangles? I think it's simply that we as a culture don't know what mathematics is. The impression we are given is of something very cold and highly technical, that no one could possibly understand- a selffulfilling prophesy if there ever was one.

It would be bad enough if the culture were merely ignorant of mathematics, but what is far worse is that people actually think they do know what math is about- and are apparently under the gross misconception that mathematics is somehow useful to society! This is already a huge difference between mathematics and the other arts. Mathematics is viewed by the culture as some sort of tool for science and technology. Everyone knows that poetry and music are for pure enjoyment and for uplifting and ennobling the human spirit (hence their virtual elimination from the public school curriculum) but no, math is important.

SIMPLICIO: Are you really trying to claim that mathematics offers no useful or practical applications to society?

SALVIATI: Of course not. I'm merely suggesting that just because something happens to have practical consequences, doesn't mean that's what it is about. Music can lead armies into battle, but that's not why people write symphonies. Michelangelo decorated a ceiling, but I'm sure he had loftier things on his mind.

## 7. Practice Problems

### 7.1 Spherical Geometry Problems

## Spherical Geometry Practice Probems

## TRUE/FALSE

1. The shortest point between two points on a sphere is on the arc of a great circle.
2. If two great circles intersect to form a right angle, they are perpendicular.
3. On a sphere there is only one distance that can be measured between two points.
4. A great circle is infinite.
5. Every two unique geodesics on a sphere must cross at two points
6. Two perpendicular 'lines' on a sphere create four right angles.
7. A triangle on a sphere may have three right angles.
8. On a sphere if two 'lines' are perpendicular to a given line, the two lines are parallel.
9. Rectangles can be drawn on a sphere.
10. true
11. true
12. false (the great circle connects the points in two ways)
13. false
14. true
15. false (there is another set of 4 at the other point the two great circles intersect)
16. true
17. false
18. false
