Forest Management with Linear Programming

Lecture 3 (4/3/2017)

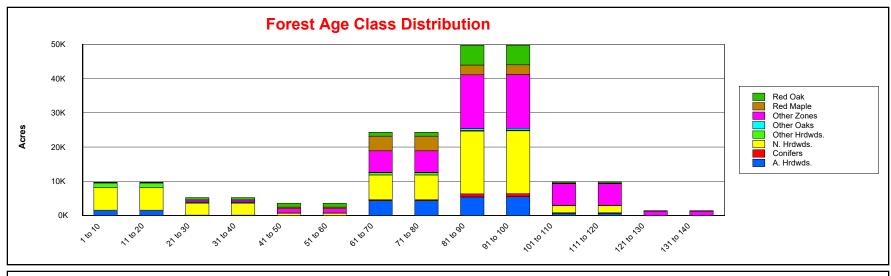

What is forest management?

 "Identifying and selecting management alternatives for forested areas, large and small, to best meet landowner objectives within the constraints of the law and the ethical obligations of the landowner to be a responsible steward of the land." (McDill's Fores Resource Management)

Key points of the definition

- Forest Management must be driven by landowner objectives;
- Resource professionals can only determine how these objectives are best met, but they cannot define the objectives themselves;
- What is best for the forest? vs. What is best for the people?
- Landowners have property rights as well as moral/ethical obligations to be good stewards.

Balancing the Age-class Distribution

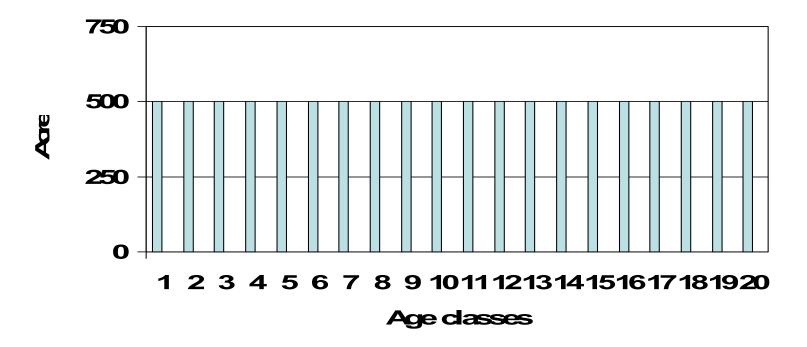

The regulated forest

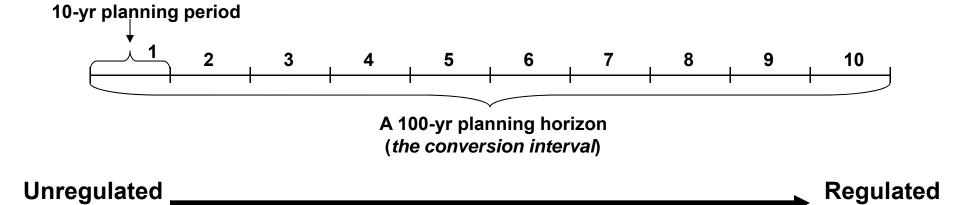

- Regulated forest: a forest with an equal number of acres in each age class
- Forest regulation: the process of converting a forest with an unbalanced age-class distribution into a regulated forest
- The purpose of forest regulation is to achieve a state where an even flow of products can be produced in perpetuity

The regulated forest cont.

- A regulated forest provides sustainability and stability
- In a regulated forest, the oldest age class is harvested each year, the age-class distribution is maintained

Planning periods and the planning horizon

forest

Since
$$A_1 = A_2 = A_3 = ... = A_R$$
 \Rightarrow $A_i = \frac{A}{R} \times n$
Period length Rotation age

Area in each age class

forest

Developing a harvest scheduling model: an example

Initial age-class distribution

Age	Acres cla		
Classes	Site I	Site II	
0-10	3,000	8,000	
11-20	6,000	4,000	
21-30	9,000	7,000	
Total	18,000 19,000		
		Ana	alysis area

Yield

Harvest	Volume (cds) by site class			
Age	Site I	Site II		
10	2	5		
20	10	14		
30	20	27		
40	31	38		
50	37	47		
60	42	54		
70	46	60		

If the acres that are initially in age-class 0-10 are to be cut in period 2, they will be 5+15=20 yrs old at the time of harvest.

Economic Data

Economic data

Item	Symbol	Amount
Wood Price	P	\$25/cd
Planting Cost	E	\$100.00/ac
Timber Sales Cost		
-per acre	$s_{\scriptscriptstyle f}$	\$15.00/ac
-per cord	s _v	\$0.20/cd
Interest Rate	r	4%

LEV

Harvest	LEV			
Age	Site I	Site II		
20	\$11.66	\$94.94		
30	\$69.83	\$147.21		
40	\$72.01	\$117.68		
50	\$31.43	\$72.04		
60	-\$2.66	\$28.60		
R*(yr)	40	30		

$$LEV_{R,s} = \frac{(P - s_{v})Y_{R,s} - s_{f} - E(1 + r)^{R}}{(1 + r)^{R} - 1}$$

Formulating the example problem as a cost minimization LP

1. Define variables

 X_{sap} = the number of acres to cut from site class s (where s=1,2,3) and initial age-class a (where a=1,2 or 3) in period p (where p=0,1,2,3 and p=0 means no harvest during the planning horizon)

Example: X_{231} = the number of acres from site class 2, initial age-class 3 to be cut in period 1.

2. Formulating the objective-function

Min
$$Z = \sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{3} c_{sap} \cdot X_{sap}$$

Where c_{sap} = the present value of the cost of assigning one acre to the variable X_{sap} .

$$\begin{aligned} \mathit{Min} \ Z &= c_{110} \cdot X_{110} + c_{111} \cdot X_{111} + c_{112} \cdot X_{112} + c_{113} \cdot X_{113} + \\ & c_{120} \cdot X_{120} + c_{121} \cdot X_{121} + c_{122} \cdot X_{122} + c_{123} \cdot X_{123} + \\ & c_{130} \cdot X_{130} + c_{131} \cdot X_{131} + c_{132} \cdot X_{132} + c_{133} \cdot X_{133} + \\ & c_{210} \cdot X_{210} + c_{211} \cdot X_{211} + c_{212} \cdot X_{212} + c_{213} \cdot X_{213} + \\ & c_{220} \cdot X_{220} + c_{221} \cdot X_{221} + c_{222} \cdot X_{222} + c_{223} \cdot X_{223} + \\ & c_{230} \cdot X_{230} + c_{231} \cdot X_{231} + c_{232} \cdot X_{232} + c_{233} \cdot X_{233} \end{aligned}$$

• Calculating c_{sap} :

$$c_{231} = \frac{E + s_f + s_v \cdot v_{231}}{(1+r)^5} = \frac{\$100/ac + \$15/ac + \$0.20/cd \cdot 27cd/ac}{(1.04)^5} = \frac{\$98.96/ac}{}$$

The general formula:
$$c_{sap} = \frac{E + s_f + s_v v_{sap}}{(1+r)^{10p-5}}$$

Note: If p=0 then c_{sap} =0

Calculating the harvest ages and volumes

	Н	arvest Ag	je	Volume – Site I			Volume – Site II		
Initial Age Class	Harvest period								
	Period Period Period Period P				Period 2	Period 3	Period 1	Period 2	Period 3
0-10	10	20	30	v ₁₁₁ =2	v ₁₁₂ =10	v ₁₁₃ =20	v ₂₁₁ =5	v ₂₁₂ =14	v ₂₁₃ =27
11-20	20	30	40	v ₁₂₁ =10	v ₁₂₂ =20	v ₁₂₃ =31	v ₂₂₁ =14	v ₂₂₂ =27	v ₂₂₃ =38
21-30	30	40	50	v ₁₃₁ =20	v ₁₃₂ =31	v ₁₃₃ =37	v ₂₃₁ =27	v ₂₃₂ =38	v ₂₃₃ =47

3. Formulating the constraints

a) Area constraints (for each analysis area): you cannot manage more acres than what you have

$$\begin{split} X_{110} + X_{111} + X_{112} + X_{113} &\leq 3,000 \\ X_{120} + X_{121} + X_{122} + X_{123} &\leq 6,000 \\ X_{130} + X_{131} + X_{132} + X_{133} &\leq 9,000 \\ X_{210} + X_{211} + X_{212} + X_{213} &\leq 8,000 \\ X_{220} + X_{221} + X_{222} + X_{223} &\leq 4,000 \\ X_{230} + X_{231} + X_{232} + X_{233} &\leq 7,000 \end{split}$$

b) Harvest target constraints: Require the production of some minimum timber output in each period

The harvest target for the first decade with Hundeshagen's formula:

$$H_1 = \frac{375,500ac}{419,583ac} \times 31,050cd / yr = \frac{27,788cd / yr}{419,583ac} \approx 280,000cd / period$$

The harvest target for the second decade: $(H_1+LTSY)/2=295,000$ cd/period

The harvest target constraint for period 1:

$$\sum_{s=1}^{2} \sum_{a=1}^{3} v_{sa1} \cdot X_{sa1} \ge H_1$$

The specific harvest target constraints for periods 1-2:

$$2X_{111} + 10X_{121} + 20X_{131} + 5X_{211} + 14X_{221} + 27X_{231} \ge 280,000$$

$$10X_{112} + 20X_{122} + 31X_{132} + 14X_{212} + 27X_{222} + 38X_{232} \ge 295,000$$

b) Ending age constraints: One way to ensure that the forest that is left standing at the end of the planning horizon will be of a desirable condition

Several alternative constraints exist:

- Target ending age-class distribution
- Target ending inventory
- iii. Average ending age constraints

Calculating the average age of a forest (example):

Age Class	Avg. Age	Acres
0-10	5	300
11-20	15	100
21-30	25	250

$$\overline{Age} = \frac{300 \cdot 5 + 100 \cdot 15 + 250 \cdot 25}{300 + 100 + 250} = 14.23 \, years$$

$$\overline{Age} = \frac{300 \cdot 5 + 100 \cdot 15 + 250 \cdot 25}{300 + 100 + 250} = 14.23 \text{ years}$$

$$\underline{\text{In general: } \overline{Age} = \sum_{i=1}^{n} \frac{Area_i}{\sum_{j=1}^{n} Area_j} Age_i$$

 Age_{sap}^{30} = the age in year 30 of acres in site class s, initial age class a that are scheduled to be harvested in period p (where p=0 implies no harvest during the planning horizon)

$$\overline{Age}^{30} = \frac{\sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{3} Age_{sap}^{30} \cdot X_{sap}}{\sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{3} X_{sap}} = \frac{\sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{3} Age_{sap}^{30} \cdot X_{sap}}{\text{Total Area}}$$

Where: \overline{Age}^{30} = the average age of the forest in year 30.

This leads to the general form of the constraint:

$$\sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{3} Age_{sap}^{30} \cdot X_{sap} \ge \overline{Age}^{30} \cdot TotalArea$$

Where \overline{Age}^{30} = the target minimum average age of the forest in year 30

Calculating the Age_{sap}^{30} coefficients:

Initial	Site I			Site II				
Age				Harvest	Period			
Class	Not Cut	Period 1	Period 2	Period 3	Not Cut	Period 1	Period 2	Period 3
0-10	$Age_{110}^{30} = 35$	$Age_{111}^{30} = 25$	$Age_{112}^{30} = 15$	$Age_{113}^{30} = 5$	$Age_{210}^{30} = 35$	$Age_{211}^{30} = 25$	$Age_{212}^{30} = 15$	$Age_{213}^{30} = 5$
11-20	$Age_{120}^{30} = 45$	$Age_{121}^{30} = 25$	$Age_{122}^{30} = 15$	$Age_{123}^{30} = 5$	$Age_{220}^{30} = 45$	$Age_{221}^{30} = 25$	$Age_{222}^{30} = 15$	$Age_{223}^{30} = 5$
21-30	$Age_{130}^{30} = 55$	$Age_{131}^{30} = 25$	$Age_{132}^{30} = 15$	$Age_{133}^{30} = 5$	$Age_{230}^{30} = 55$	$Age_{231}^{30} = 25$	$Age_{232}^{30} = 15$	$Age_{233}^{30} = 5$

How should we set the minimum average ending age: \overline{Age}^{30}

What is the average age of the regulated forest? $(R^*+1)/2$

Site I: (40+1)/2= 20.5 Site II: (30+1)/2=15.5

Average for the two sites: 17.93yrs

$$35X_{110} + 25X_{111} + 15X_{112} + 5X_{113} + 45X_{120} + 25X_{121} + 15X_{122} + 5X_{123} + 55X_{130} + 25X_{131} + 15X_{132} + 5X_{133} + 35X_{210} + 25X_{211} + 15X_{212} + 5X_{213} + 45X_{220} + 25X_{221} + 15X_{222} + 5X_{223} + 55X_{230} + 25X_{231} + 15X_{232} + 5X_{233} \ge 629,000$$

Non-negativity Constraints

$$X_{sap} \ge 0$$
 s=1,2; a=1,2,3; p=0,1,2,3

Harvest Scheduling with Profit Maximization

- No harvest targets are necessary
- More flexibility
- One can let the model tell how much to harvest
- Disadvantage: the price of wood must be projected for the duration of the planning horizon

The objective function:

Max
$$Z = \sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{2} C_{sap}^{p} \cdot X_{sap}$$

where c_{sap}^{p} = the present value of the net revenue of assigning one acre to variable X_{sap}

$$C_{sap}^{p} = \begin{cases} \frac{P \cdot V_{sap} - [E + S_{f} + S_{v} \cdot V_{sap}]}{(1 + r)^{10p - 5}} = \frac{(P - S_{v}) \cdot V_{sap} - E - S_{f}}{(1 + r)^{10p - 5}} & \text{for p > 0} \\ 0 & \text{for p = 0} \end{cases}$$

Example:

$$c_{231}^{p} = \frac{(P - s_{v}) \cdot V_{231} - E - s_{f}}{(1 + r)^{10 \cdot 1 - 5}}$$

$$= \frac{(\$25 / cd - \$0.2 / cd) \cdot 27cd / ac - \$100 / ac - \$15 / ac}{1.04^{5}}$$

$$= \frac{\$455.84 / ac}{}$$

Constraints

 Area constraints (same as in the cost minimization problem):

$$\sum_{\rho=0}^{2} X_{sap} \le A_{sa} \quad \text{for s=1,2 and a=1,2,3}$$

$$X_{110} + X_{111} + X_{112} \le 3,000$$

$$X_{120} + X_{121} + X_{122} \le 6,000$$

$$X_{130} + X_{131} + X_{132} \le 9,000$$

$$X_{210} + X_{211} + X_{212} \le 8,000$$

$$X_{220} + X_{221} + X_{222} \le 4,000$$

$$X_{230} + X_{231} + X_{232} \le 7,000$$

Constraint cont.

 Harvest fluctuation constraints: limit the amount the harvest can go up or down from one period to the next and ensures an even flow of timber from the forest

$$H_2 \ge 0.85 \cdot H_1$$
 and $H_2 \le 1.15 \cdot H_1$

The harvest target constraint from cost minimization:

$$\sum_{s=1}^{2} \sum_{a=1}^{3} v_{sap} \cdot X_{sap} \ge H_{p} \quad \text{for p=1,2}$$

The harvest accounting constraint for profit maximization:

$$\sum_{s=1}^{2} \sum_{a=1}^{3} V_{sap} \cdot X_{sap} - H_{p} = 0 \qquad \text{for p=1,2}$$

Constraints cont.

Harvest fluctuation constraints cont.

$$0.85H_1 - H_2 \le 0$$
$$-1.15H_1 + H_2 \le 0$$

$$2X_{111} + 10X_{121} + 20X_{131} + 5X_{211} + 14X_{221} + 27X_{231} - H_1 = 0$$

$$10X_{112} + 20X_{122} + 31X_{132} + 14X_{212} + 27X_{222} + 38X_{232} - H_2 = 0$$

Constraints cont.

 Average ending age constraints (same as in cost minimization):

$$\sum_{s=1}^{2} \sum_{a=1}^{3} \sum_{p=0}^{2} Age_{sap}^{20} \times X_{sap} \ge \overline{Age}^{20} \times TotalArea$$

$$25X_{110} + 15X_{111} + 5X_{112} + 35X_{120} + 15X_{121} + 5X_{122}$$

$$+45X_{130} + 15X_{131} + 5X_{132} + 25X_{210} + 15X_{211} + 5X_{212}$$

$$+35X_{220} + 15X_{221} + 5X_{222} + 45X_{230} + 15X_{231} + 5X_{232} \ge 629,000$$

Constraints cont.

Non-negativity constraints:

$$X_{sap} \ge 0$$
 for s=1,2 a=1,2,3 p=0,1,2 and $H_p \ge 0$ for p=1,2

$$\begin{aligned} \textit{Max} \ \ Z &= -53.75 X_{111} + 73.85 X_{112} + 109.32 X_{121} + 211.56 X_{122} \\ &+ 313.15 X_{131} + 363.03 X_{132} + 7.40 X_{211} + 128.93 X_{212} \\ &+ 190.85 X_{221} + 307.95 X_{222} + 455.84 X_{231} + 459.43 X_{232} \end{aligned}$$

$$+313.13X_{131} + 303.03X_{132} + 7.40X_{211} + 128.93X_{212} + 190.85X_{221} + 307.95X_{222} + 455.84X_{231} + 459.43X_{23}$$
 subject to
$$X_{110} + X_{111} + X_{112} \le 3,000$$

$$X_{120} + X_{121} + X_{122} \le 6,000$$

$$X_{130} + X_{131} + X_{132} \le 9,000$$

$$X_{210} + X_{211} + X_{212} \le 8,000$$

$$X_{220} + X_{221} + X_{222} \le 4,000$$

$$X_{230} + X_{231} + X_{232} \le 7,000$$

$$0.85H_1 - H_2 \le 0$$

$$-1.15H_1 + H_2 \le 0$$

$$2X_{111} + 10X_{121} + 20X_{131} + 5X_{211} + 14X_{221} + 27X_{231} - H_1 = 0$$

$$10X_{112} + 20X_{122} + 31X_{132} + 14X_{212} + 27X_{222} + 38X_{232} - H_2 = 0$$

$$25X_{110} + 15X_{111} + 5X_{112} + 35X_{120} + 15X_{121} + 5X_{122} + 45X_{130} + 15X_{131} + 5X_{132} + 25X_{210} + 15X_{211} + 5X_{212} + 45X_{230} + 15X_{231} + 5X_{232} \ge 629,000$$

$$X_{sap} \ge 0 \qquad \text{for s=1,2} \quad \text{a=1,2,3} \quad \text{p=0,1,2}$$
and H > 0 \quad \text{for p=1,2}

and $H_n \ge 0$ for p=1,2
