

## TCSS 360: SOFTWARE DEVELOPMENT AND QUALITY ASSURANCE

# Software Design and SOLID Principles

Wes J. Lloyd  
 Institute of Technology  
 University of Washington - Tacoma

```

classDiagram
    class SessionMgr {
        read_from_db()
        store_in_db()
    }
    class Database {
        get_session()
        store_session()
    }
    class SessionStore {
        <<interface>>
    }
    SessionMgr --> Database
    Database ..|> SessionStore
    
```

## OBJECTIVES

- From chapter 11: Engineering SaaS
  - SOLID Design Principles
  - Design Patterns
  - Software Metrics

February 1, 2017    TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma    L8.2

## SOLID DESIGN GUIDELINES

- **Single Responsibility**
  - A class should have one and only one reason to change
- **Open/Closed**
  - Classes should be open for extension but closed for modification
- **Liskov Substitution**
  - Substituting a subclass for a class should preserve correct program behavior
- **Interface Segregation**
  - No client should depend on methods it does not use
- **Injecting Dependencies**
  - Collaborating classes who implementation may vary at runtime should depend on an intermediate "injected" dependency

February 1, 2017    TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma    L8.3

## SINGLE RESPONSIBILITY PRINCIPLE

- A class should have one and only one responsibility
- Example: class named "Reviewers" in CoffeeFinder which defines information about users who review coffee shops
- A "sign-on" operation could be added to "Reviewers" to enable a reviewer to log in
- This does not separate responsibility!
- **Single Responsibility:** Use a "Sessions" class
  - Decouples the design of logging-in from the Reviewers Class
  - What if the authentication strategy changes?
  - Reviewers class would need to change

February 1, 2017    TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma    L8.4

## SINGLE RESPONSIBILITY - 2

- "Sign-on" operation added to "Reviewers" Class
  - How do other classes of users sign-on?
  - Does each user class implement their own?
- Decouple key features/functions into reusable classes
- **MVC: Controllers**
- Each controller provides business logic for system components
- Components
  - ReviewerController: User who contributes coffee shop reviews
  - UserController: General system user
  - AdminController: Admin user that performs DB maintenance

February 1, 2017    TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma    L8.5

## OPEN/CLOSED PRINCIPLE (OCP)

- Classes should be: **open** for extension, but **closed** for modification
- Extending a class shouldn't require modifying existing code
- Case statement code smell:
- Factory pattern
- Template pattern
- Strategy pattern

```

class Report {
  def output
    formatter =
      case @format
      when :html
        HtmlFormatter.new(self)
      when :pdf
        PdfFormatted.new(self)
      # ... Etc
    end
  end
end
    
```

February 1, 2017    TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma    L8.6

## LISKOV SUBSTITUTION PRINCIPLE (LSP)

- Class subtypes can substitute for base types
- Current formulation attributed to (Turing Award winner) Barbara Liskov

"A method that works on an instance of type *T*, should also work on any subtype of *T*"

Type/subtype != Class/subclass  
All of *T*'s subtypes should preserve *T*'s contract...

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.7

## INTERFACE SEGREGATION PRINCIPLE (ISP)

- Clients should not be forced to depend on methods they do not use...
- Split large interfaces into smaller, more specific ones
- ISP reduces coupling
- High code coupling is correlated with higher software maintenance costs
  - Code is harder to modify, refactor, extend

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.8

## ISP: COUPLING SUMMARY

- Coupling measures dependencies between subsystems
- High coupling: changes to one subsystem will have high impact on the other subsystem - BAD!!
  - Require change of model, massive compilation
- Low coupling: change in one subsystem does not affect any other subsystem - - GOOD!!

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.9

## DEPENDENCY INVERSION PRINCIPLE (DIP)

- Also called **dependency Injection**...
- If two classes depend on each other, but their implementations may change, it is better if they depend on an abstract interface that is **"Injected"** dynamically
- Enables interface to change with changing original class
- Code is not statically bound to the external dependency

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.10

## DIP: EXAMPLE

- Example:** one class (user code), makes use of a 3<sup>rd</sup> party library or framework (e.g. logging API)
- Without dependency injection, the user class is dependent (coupled) to the 3<sup>rd</sup> party library or framework
- "Coupling" becomes pandemic throughout the code
- It's everywhere...
- If the 3<sup>rd</sup> party library goes defunct (company or group disbands), program code is now dependent on an unsupported library
- Solution: Inject an abstract logging interface (which a 3<sup>rd</sup> party library or framework implements)

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.11

## DIP: JAVA EXAMPLE

- Traditional coupling to logging class (API)
- Program must have access to a specific 3<sup>rd</sup> party library

```
package com.example.e4.rcp.todo.parts;

import java.util.logging.Logger;

public class MyClass {

    private final static Logger logger;

    public MyClass(Logger logger) {
        this.logger = logger;
        // write an info log message
        logger.info("This is a log message.")
    }

}
```

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
Institute of Technology, University of Washington - Tacoma

L8.12

## DIP: JAVA EXAMPLE - 2

- Using Java annotations to inject to dependent logger
- Enables use of "mock objects" for testing
- Can inject a "mock object" of a library not yet available
  - Another developer may be completing the code
  - Mock object implements generic interface

```
public class MyPart {
    @Inject private Logger logger;
    // inject class for database access
    @Inject private DatabaseAccessClass dao;
    @Inject
    public void createControls(Composite parent) {
        logger.info("UI will start to build");
        Label label = new Label(parent, SWT.NONE);
        label.setText("Eclipse 4");
        Text text = new Text(parent, SWT.NONE);
        text.setText(dao.getNumber());
    }
}
```

 Institute of Technology, University of Washington - Tacoma

L8.15

## DIP: JAVA ANNOTATIONS

- Annotation location** - where the dependency is injected
  - Constructor of the class (construction injection)
  - Field variable (field injection)
  - Parameters of a method (method injection)
- Dependency injection occurs in same order: constructor, fields, method parameters
- Frameworks exist to assist native dependency injection

- AspectJ  
Aspect Oriented Programming

February 1, 2017

TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma

L8.14

## DIP: ASPECT ORIENTED PROGRAMMING

- Language extension for dynamic dependency injection (AspectJ)
- Less coupling than with Java annotations (interface)
- Programming paradigm to increase modularity by separating **cross-cutting concerns**.
- Behavior is declared into "advices", similar to a classes - they define behavior (e.g. logging) without modifying main program.
- Pointcut specifications** define where **advices** are to be automatically "weaved" into the main program...
- Example **pointcut**: log all function calls when the function's name begins with 'set'.
- Behaviors not central to the business logic (such as logging) can be added to a program without changing or cluttering main program
- AOP forms the basis for aspect-oriented software development.

TCSS360: Software Development and Quality Assurance [Winter 2017]  
 Institute of Technology, University of Washington - Tacoma

L8.15

## COUPLING LEVELS

- Content**: one module relies on internal workings or data of another. One class reads/depends on another internal variables
- Common**: two modules share global data; all modules using the global data are impacted by a change
- External**: two modules share an externally imposed data format, communication protocol, device interface
- Control**: one module controls the flow of another by passing it information on what to do
- Stamp**: modules share a common data structure, though may only sparsely use some of its **Java annotations (interface coupling)**
- Data**: modules share data through parameters passing
- Message**: modules communicate through message passing code not explicitly coupled, messages come through channels

AspectJ (functionality injected at joinpoints)

 Institute of Technology, University of Washington - Tacoma

L8.16

## DIP: ADAPTER PATTERN

- Alternate solution to dependency inversion
- Define an "Adapter" class
- Serves to convert an existing API into one that's compatible with an existing caller

```
public interface MediaPlayer {
    public void play(String audioType, String fileName);
}

public interface AdvancedMediaPlayer {
    public void playVlc();
    public void playMp4();
}

public class VlcPlayer implements AdvancedMediaPlayer ... {}

public class MediaAdapter implements MediaPlayer {
    AdvancedMediaPlayer advancedMusicPlayer;

    public MediaAdapter(String audioType){
        if(audioType.equalsIgnoreCase("vlc")) {
            advancedMusicPlayer = new VlcPlayer();
        } else if (audioType.equalsIgnoreCase("mp4")) {
            advancedMusicPlayer = new Mp4Player();
        }
    }

    @Override
    public void play(String audioType, String fileName) {
        if(audioType.equalsIgnoreCase("vlc")){
            advancedMusicPlayer.playVlc(fileName);
        }
        else if (audioType.equalsIgnoreCase("mp4")) {
            advancedMusicPlayer.playMp4(fileName);
        }
    }
}
```

**Adapter pattern:**  
 Supports adding new media player features without changing dependent code...

Adapter Class
