

TCSS 558: APPLIED DISTRIBUTED COMPUTING

Distributed Systems: Goals and Types

Wes J. Lloyd
Institute of Technology
University of Washington - Tacoma

OBJECTIVES

- Course demographics survey – missing surveys
- Feedback from 9/28
- Design goals of distributed systems
 - Resource sharing / availability
 - Distribution transparency
 - Openness
 - Scalability
- Activity: Design goals of distributed systems
- Types of distributed systems
 - HPC, cluster, grid, cloud
 - Distributed information systems
 - Pervasive systems
- Research directions

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.2

FEEDBACK – 9/28

- What is the difference between extensibility and scalability?
 - Extensibility – ability for a system implementation to be extended with additional functionality
 - Scalability – ability for a distributed system to scale (up or down) in response to client demand
- What is the loss of availability in a distributed system?
 - Availability refers to “uptime”
 - How many 9s
 - $(1 - (\text{down time} / \text{total time})) * 100\%$
- Transparency: term is confusing
 - Generally means “exposing everything”, obfuscation is better
 - Distribution transparency means the implementation of the distribution cannot be seen

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.3

FEEDBACK - 2

- What do we mean by replication transparency?
 - Resource are automatically replicated (by the middleware/framework)
 - That fact that there are distributed system has replica nodes is unbeknownst to the users
- How does replication improve system performance?
 - By replicating nodes, system load is “distributed” across replicas
 - Distributed reads – many concurrent users can read
 - Distributed writes – when replicating data, requires synchronization of copies

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.4

DESIGN GOALS OF DISTRIBUTED SYSTEMS

- Support for sharing resources (accessibility)
- Distribution transparency
- Openness (avoiding vendor lock-in)
- Scalability
- Back to slide 15. . .

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.5

OPENNESS

- **Extensible**: easy to reconfigure, add, remove, replace components from different developers
- Example: replace the underlying file system of a distributed system
- To be open, we would like to ***separate policy from mechanism***
 - Policy may change
 - Mechanism is the technological implementation
 - Avoid coupling policy and mechanism
 - Enables flexibility
 - Similar to separation of concerns, modular/OO design principle

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.6

OPENNESS: EXAMPLE

- Separation of policy and mechanism: web browser caching
- Mechanism: browser provides facility for storing documents
- Policy: Users decide which documents, for how long, ...

- Goal: Enable users to set policies dynamically
- For example: browser may allow separate component plugin to specify policies

- Tradeoff: management complexity vs. policy flexibility
- Static policies are inflexible, but are easy to manage as features are barely revealed.

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.7

TYPES OF SCALABILITY

- Size scalability: distributed system can grow easily without impacting performance
 - Supports adding new users, processes, resources
- Geographical scalability: users and resources may be dispersed, but communication delays are negligible
- Administrative scalability: An administratively scalable system

- Most systems only account for size scalability
- One solution is to operate multiple parallel independent nodes

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.8

SIZE SCALABILITY

- Centralized architectures have limitations
- At some point a single central coordinator/arbitrator node can't keep up
 - Centralized server: limited CPU, disk, network capacity
- Scaling requires surmounting bottlenecks

Lloyd W, Pallickara S, David O, Lyon J, Arabi M, Rojas K. Migration of multi-tier applications to infrastructure-as-a-service clouds: An investigation using kernel-based virtual machines. InGrid Computing (GRID), 2011 12th IEEE/ACM International Conference on 2011 Sep 21 (pp. 137-144). IEEE.

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.9

GEOGRAPHIC SCALABILITY

- Nodes dispersed by great distances
 - Communication is slower, less reliable
 - Bandwidth may be constrained
- How do you support synchronous communication?
 - Latencies may be higher
 - Synchronous communication may be too slow and timeout
 - WAN links can be unreliable

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.10

ADMINISTRATIVE SCALABILITY

- **Conflicting policies regarding usage (payment), management, and security**
- **How do you manage security for multiple, discrete data centers?**
- **Grid computing: how can resources be shared across disparate systems at different domains, etc. ?**

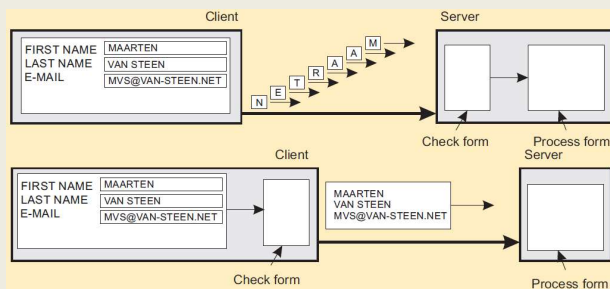

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.11

APPROACHES TO SCALING

- **Hide communication latencies**
 - Use asynchronous communication to do other work and hide latency
 - Remote server runs in parallel in the background – client not locked
 - Separate event handler captures return response from server
- **Hide latency by moving key press validation to client:**

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.12

APPROACHES TO SCALING - 2

- Partitioning data and computations across machines
- Just one copy
 - Where is the copy?
- Move computations to the client
 - Thin client → thick client
 - Edge, fog, cloud....
- Decentralized naming services (DNS)
- Decentralized information services (WWW)

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.13

APPROACHES TO SCALING - 3

- Replication and caching – make copies of data available at different machines
- Replicated file servers and databases
- Mirrored web sites
- Web caches (in browsers and proxies)
- File caches (at server and client)

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.14

PROBLEMS WITH REPLICATION

- Having multiple copies leads to inconsistency (cached or replicated)
- Modifying one copy invalidates all of the others
- Keeping copies consistent requires global synchronization
- Global-synchronization prohibits large-scale up
 - Best to synchronize just a few copies or synchronization latency becomes too long, entire system slows down!
 - ***Consider how synchronization time increases with system size***
- Can inconsistencies be tolerated?
 - Current temperature and wind speed for weather.com
 - Bank account balance – for a read only statement
 - Bank account balance – for a transfer/withdrawal transaction

October 3, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.15

DESIGN GOALS ACTIVITY

DEVELOPING DISTRIBUTED SYSTEMS

- Developing a distributed system is a formidable task
- Many issues to consider:
 - Reliable networks do not exist
 - Networked communication is inherently insecure

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.17

FALSE ASSUMPTIONS ABOUT DISTRIBUTED SYSTEMS

- The network is reliable
- The network is secure
- The network is homogeneous
- The topology does not change
- Latency is zero
- Bandwidth is infinite
- Transport cost is zero
- There is one administrator

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.18

TYPES OF DISTRIBUTED SYSTEMS

L2.19

TECHNOLOGY INNOVATIONS LEADING TO CLOUD COMPUTING

- Super computers
 - Huge multiprocessor system which shares RAM
 - Technically “not distributed”
 - Hardware all in one location
- High performance distributed computing
 - Cluster computing
 - Grid computing
 - Cloud computing
 - Virtualization
 - Others

October 3, 2017	TCSS 558: Applied Distributed Computing [Fall 2017] Institute of Technology, University of Washington - Tacoma	L2.20
-----------------	---	-------

EARLY CLUSTER - 1996

- Inktomi search engine on Network of Workstations (NOW) @ UC Berkeley in 1996

October 3, 2017

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.21

CLUSTER COMPUTING

- Cluster computing (clustering)
 - Cluster is a group of independent IT resources interconnected as a single system
 - Off-the-shelf computers connected via a high-speed network
 - Servers configured with homogeneous hardware and software
 - Identical or similar RAM, CPU, HDDs
 - Design emphasizes redundancy as server components are easily interchanged to keep overall system running
 - Example: if a RAID card fails on a key server, the card can be swapped from another redundant server
 - Clusters provide “warm” replication of servers
 - Key servers are duplicated to provide HW failover to ensure high availability (HA)

October 3, 2017

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.22

COMPUTER CLUSTERS

- **Clusters: Commodity computers connected by Ethernet switches**
 - More scalable than conventional servers
 - Much cheaper than conventional servers
 - Dependability through extensive redundancy
 - Few administrators for 1000s servers
- **Careful selection of identical HW/SW**
 - Interchangeable components
- **Virtual Machine Monitors simplify operation**

October 3, 2017

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.23

GRID COMPUTING

- **On going research area since early 1990s**
- **Distributed heterogeneous computing resources organized into logical pools of loosely coupled resources**
- **For example: heterogeneous servers connected by the internet**
- **Resources are heterogeneous and geographically dispersed**
- **Grids use middleware software layer to support workload distribution and coordination functions**
- **Aspects: load balancing, failover control, autonomic configuration management**
- **Grids have influenced clouds contributing common features: networked access to machines, resource pooling, scalability, and resiliency**

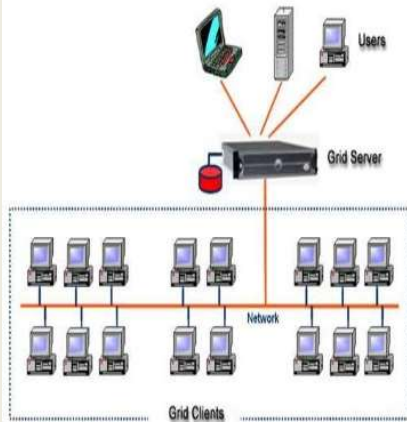

October 3, 2017

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.24

GRID COMPUTING - 2

How Grid computing works ?

In general, a grid computing system requires:

- At least one computer, usually a server, which handles all the administrative duties for the System
- A network of computers running special grid computing network software.
- A collection of computer software called middleware

October 3, 2017

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.25

GRID COMPUTING - 3

- Grids are built by federating compute resources together from many organizations
- Virtual organization
 - Users from different organizations participate together in a virtual organization
 - Jobs belonging to a virtual organization can harness resources owned by the virtual organization
- Grids bring together heterogeneous hardware owned by many organizations

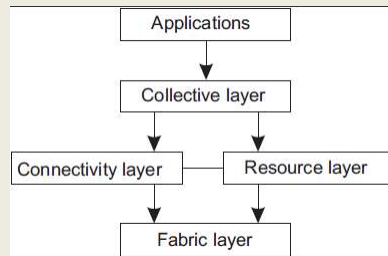

October 3, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.26

GRID COMPUTING LAYERS

- **Application layer**
 - Applications operating within a virtual organization sharing grid resources
- **Middleware layers**
 - **Collective layer**
 - Provides access to multiple resources
 - Services for discovery, allocation, scheduling, data replication, etc.
 - **Connectivity layer**
 - Communication protocols to support transactions across grid
 - Data transfer, access to resources, security (authentication) protocols
 - **Resource layer**
 - Manages access to a single resource via fabric layer
 - Configuration of a specific resource
 - Security (access control)
- **Fabric layer**

October 3, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.27

CLOUD COMPUTING NIST GENERAL DEFINITION

“Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (networks, servers, storage, applications and services) that can be rapidly provisioned and reused with minimal management effort or service provider interaction”...

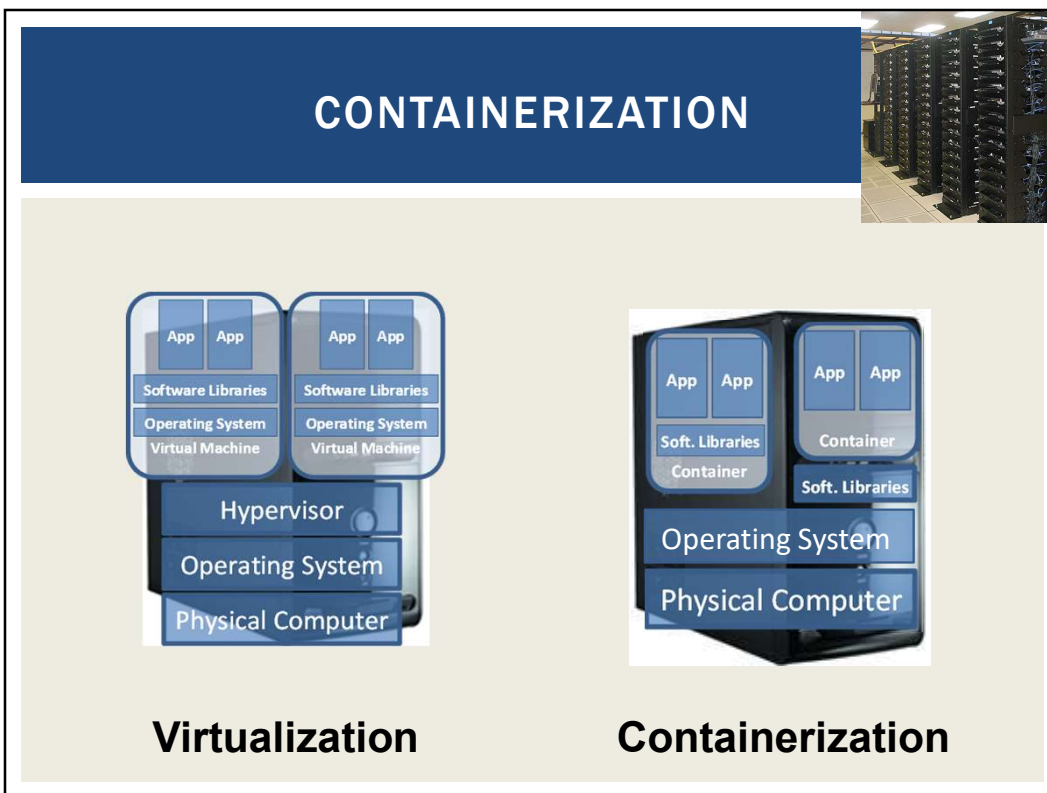

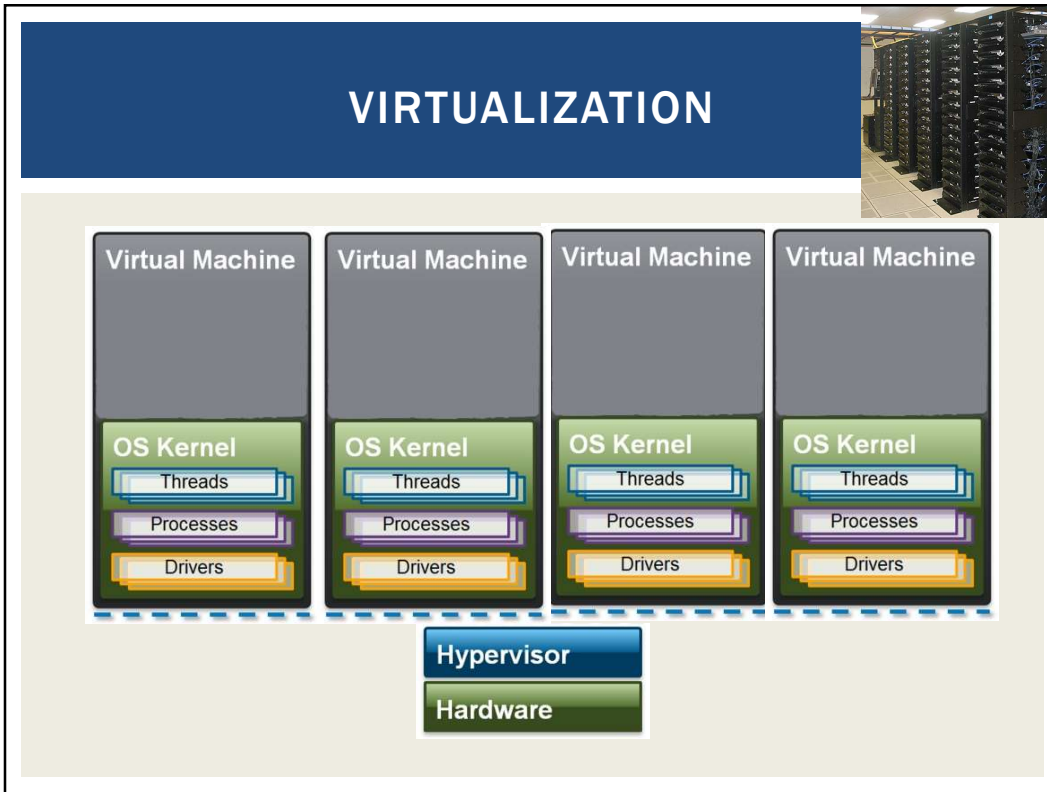

MICROPROCESSORS ADVANCEMENTS

- **Smaller die sizes (microns)**
 - Lower voltages
 - Improved heat dissipation
 - Energy conservation
 - More transistors, but with similar clock rates
- **Leads to multicore CPUs**
 - Means to harness new transistor density
 - Improve overall computational throughput
- **How do we utilize many-core processors?**

VIRTUALIZATION

HOW WAREHOUSE SCALE COMPUTING BECAME THE CLOUD

- Clusters grew from 1,000 servers to 100,000+ based on customer demand for SaaS apps
- Economies of scale pushed down costs by 3X to 8X
 - Purchase, house, operate 100K vs. 1K computers
 - Traditional datacenters utilization is ~ 10% - 20%
- Earn \$ offering pay-as-you-go computing at prices lower than customer's costs;
 - Scalable → as many computers as customer needs

TCSS 558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L2.33

CLOUD COMPUTING STACK

PUBLIC CLOUD EXAMPLE: NETFLIX

- Amazon Elastic Compute Cloud (EC2)
 - Continuously run 20,000 to 90,000 VM instances
 - Across 3 regions
 - Host 100s of microservices
 - Process over 100,000 requests/second
 - Host over 1 billion hours of monthly content

PUBLIC CLOUD COMPUTING

- Offers computing, storage, communication at ¢ per hour
- No premium to scale:

$$= \frac{1000 \text{ computers}}{1 \text{ computer}} @ \frac{1 \text{ hour}}{1000 \text{ hours}}$$
- Illusion of infinite scalability to cloud user
- As many computers as you can afford
- Leading examples:
Amazon Web Services, Google App Engine, Microsoft Azure
- Amazon runs its own e-commerce on AWS!
- Billing models are becoming increasingly granular
 - By the minute, second, tenth of a second
 - Obfuscated pricing-Lambda \$0.0000002 per request
\$0.000000208 to rent 128MB / 100-ms

October 3, 2017	TCSS 558: Applied Distributed Computing [Fall 2017] Institute of Technology, University of Washington - Tacoma	L2.38
-----------------	---	-------

PUBLIC CLOUD COMPUTING

- Offers computing, storage, communication at ¢ per hour
- No premium to scale:

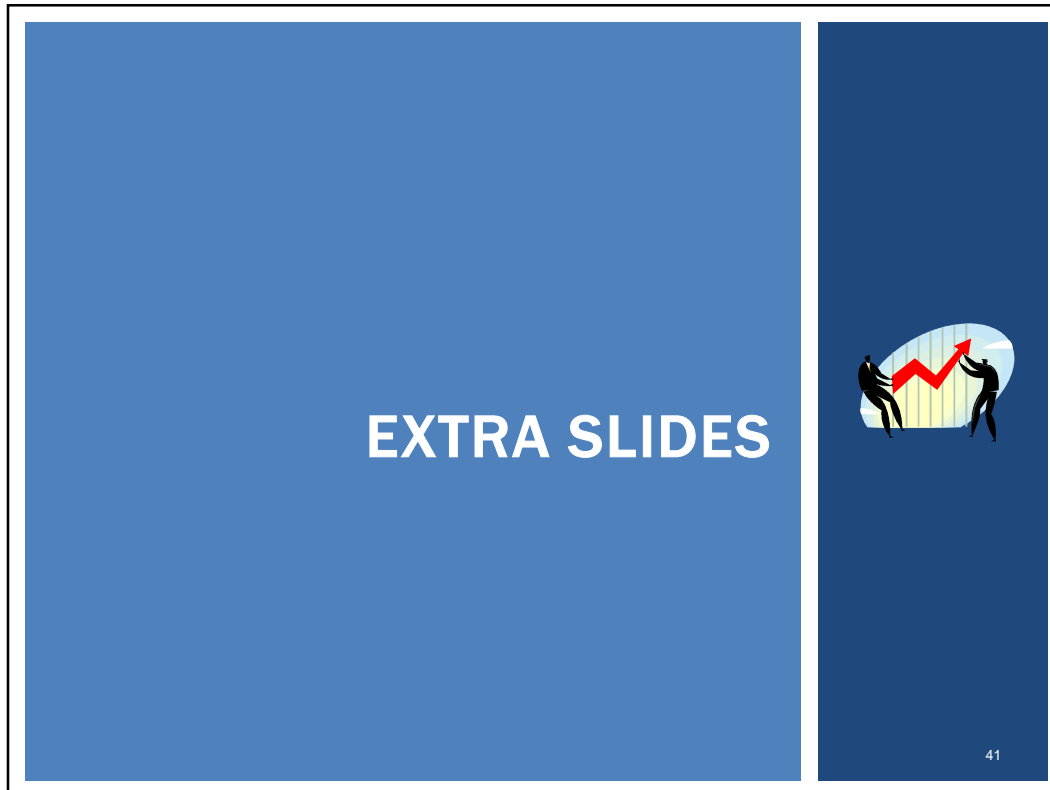

m4.large example
 2 vCPU cores, 8 GB RAM, Intel Xeon E5-2666 v3
 10¢ an hour
 24hrs/day
 30 day/month → \$72.00/month
 on-demand EC2 instance
- Illusion of ownership
- As much as you need
- Leading provider: Amazon
- Amazon **AWS Lambda?** **\$346.51**
- Billing
 - By the minute, second, tenth of a second
 - Obfuscated pricing-Lambda \$0.0000002 per request
 \$0.000000208 to rent 128MB / 100-ms
