

TCSS 558: APPLIED DISTRIBUTED COMPUTING

Distributed Systems: Architectures and Middleware

Wes J. Lloyd
Institute of Technology
University of Washington - Tacoma

OBJECTIVES

- Feedback from 10/10
- Ch. 2 - Architectural styles
 - Event-based / publish & subscribe
- Class activity: architectural styles
- Middleware organization
- System architectures
 - Centralized: Single client, multi-tier
 - Decentralized peer-to-peer: structured, unstructured, hierarchical
 - Hybrid

October 12, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.2

FEEDBACK - 10/10

- What is the difference between a centralized vs. decentralized architectural style?
- Why is a centralized system less available? (fewer 9s)

Availability is measured in percentage uptime (e.g. 99.9%)

October 12, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.3

FEEDBACK - 2

- Still confused about RMI...
Could you please give a detailed example to show why and how an object should invoke the method of a remote object?
- The use cases for distributed objects will vary
- These are the same reasons we “distribute” the system
- Local CPU resources of a node may be insufficient to complete work in a timely manner → outsource the computation
- Data required to complete the computation may be unavailable at local node → move the computation to the data
 - *It may be too slow or expensive to move the data to the node*
- Local node may be unauthorized to directly access data required for computation → delegate to authorized host

L5.4

FEEDBACK - 3

- For assignment 0:
After building the tomcat container, and using
“docker images -a”, my image has a name of <none>.
- Need to include the “-t” flag on docker build
- See “man docker-build” or “docker build --help”
- Can also include a version number:
- `docker build -t <name>:<version> <path to Dockerfile>`
- **Example:**
`docker build -t tcss558test:version1 .`

L5.5

CH. 2: DISTRIBUTED SYSTEMS ARCHITECTURES

L5.9

PUBLISH-SUBSCRIBE ARCHITECTURES

- Enables separation between processing and coordination
- Types of coordination:

	Temporally coupled (at the same time)	Temporally decoupled (at different times)
Referentially coupled (<i>dependent on name</i>)	Direct Explicit synchronous service call	Mailbox Asynchronous by name (address)
Referentially decoupled (<i>name not required</i>)	Event-based Event notices published to shared bus, w/o addressing	Shared data space Processes write tuples to a shared data space

Not publish and subscribe

October 12, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
 Institute of Technology, University of Washington - Tacoma

L5.10

PUBLISH-SUBSCRIBE ARCHITECTURES - 2

- **Event-based coordination**
- Processes do not know about each other explicitly
- **Processes:**
 - **Publish:** a notification describing an event
 - **Subscribe:** to receive notification of specific kinds of events
- Assumes subscriber is presently up (*temporally coupled*)

October 12, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
 Institute of Technology, University of Washington - Tacoma

L5.11

PUBLISH SUBSCRIBE ARCHITECTURES - 3

- **Shared data space**
- Full decoupling (name and time)
- Processes publish “tuples” to shared dataspace (publish)
- Processes provide search pattern to find tuples (subscribe)
- When tuples are added, subscribers are notified of matches
- **Key characteristic:**
Processes have no explicit reference to each other

October 12, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.12

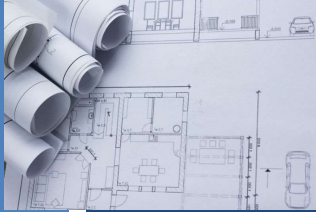

PUBLISH SUBSCRIBE ARCHITECTURES - 4

- Subscriber describes events interested in
- Complex descriptions are intensive to evaluate and fulfil
- **Middleware will:**
- Publish matching notification and data to subscribers
 - Common if middleware lacks storage
- Publish only matching notification
 - Common if middleware provides storage facility
 - Client must explicitly fetch data on their own
- Publish and subscribe systems are generally scalable
- **What would reduce the scalability of a publish-and-subscribe system?**

L5.13

IN-CLASS ACTIVITY: DISTRIBUTED SYSTEMS ARCHITECTURES

L5.14

DISTRIBUTED SYSTEM GOALS TO CONSIDER

- Consider how the architectural change may impact:
- Availability
- Accessibility
- Responsiveness
- Scalability
- Openness
- Distribution transparency
- Supporting resource sharing
- Other factors...

October 10, 2017	TCSS558: Applied Distributed Computing [Fall 2017] Institute of Technology, University of Washington - Tacoma	L4.15
------------------	--	-------

MIDDLEWARE ORGANIZATION

The diagram illustrates the flow of a request through a middleware organization. It starts with a Client application (B.doit(val)) which calls an Application stub. The stub sends a Nonintercepted call to Object middleware (invoke(B, doit, val)). A Request-level interceptor and a Message-level interceptor both intercept the call. The Request-level interceptor intercepts the call before it reaches the Object middleware. The Message-level interceptor intercepts the call after it has been processed by the Object middleware. The final call is sent to Local OS (send(B, doit, val)), which then sends the request to Object B.

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L10.16

MIDDLEWARE: WRAPPERS

- **Wrappers (adapters)**
 - Special “frontend” components that provide interfaces to client
 - Interface wrappers transform client requests to “implementation” at the component-level
 - Provide modern services interfaces for legacy code/systems
 - Enable meeting all preconditions for legacy code to operate
 - Parameterization of functions, configuration of environment
- Contributes towards system openness
- **Example: Amazon S3**
 - Client uses REST interface to GET/PUT/DELETE/POST data
 - S3 adapts and hands off REST requests to system for fulfillment

October 12, 2017

TCCS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.17

MIDDLEWARE: WRAPPERS - 2

- **Inter-application communication**
 - Application provides unique interface for every application
- **Scalability suffers**
 - N applications $\rightarrow O(N^2)$ wrappers
- **Broker**
 - Provide a common intermediary
 - Broker knows how to communicate with every application
 - Applications only know how to communicate with the broker

October 12, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.18

MIDDLEWARE: INTERCEPTORS

- **Interceptor**
- Software construct, breaks flow of control, allows other application code to be executed
- Enables remote procedure calls (RPC), remote method invocation (RMI)
- Object A can call a method belonging to object B on a different machine than A.

October 12, 2017

TCSS558: Applied Distributed Computing [Fall 2017]
Institute of Technology, University of Washington - Tacoma

L5.19

MIDDLEWARE INTERCEPTION - METHOD

- Local interface matching Object B is provided to Object A
- Object A calls method in this interface
- A's call is transformed into a "generic object invocation" by the middleware
- The "generic object invocation" is transformed into a message that is sent over Object A's network to Object B.
- Request-level interceptor automatically routes all calls to object replicas

Institute of Technology, University of Washington - Tacoma

L5.20

MODIFIABLE MIDDLEWARE

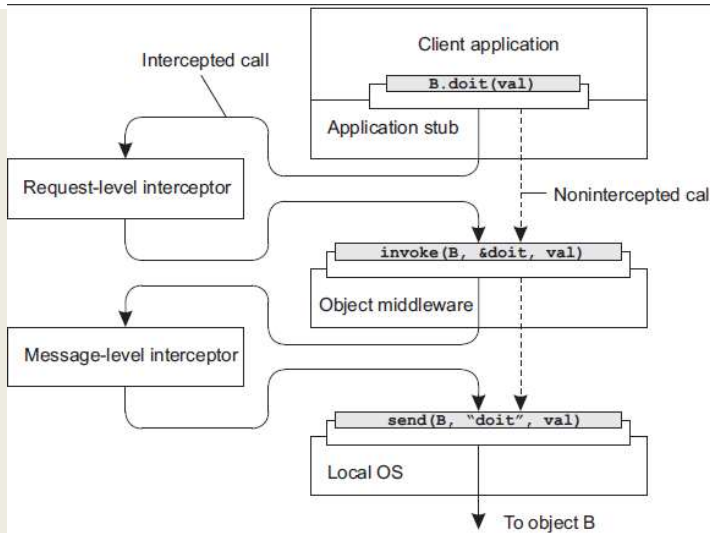

- It should be possible to modify middleware without loss of availability
- Software components can be replaced at runtime
- Component-based design
 - Modifiability through composition
 - Systems may have static or dynamic configuration of components
 - Dynamic configuration requires late binding
 - Components can be changed at runtime
- Component based software supports modifiability at runtime by enabling components to be swapped out.
- Does a microservices architecture (e.g. AWS Lambda) support modifiability at runtime ?

L5.23

The slide features a large blue rectangular area on the left containing the text "EXTRA SLIDES" in white, bold, uppercase letters. To the right is a vertical dark blue bar. Inside this bar is a graphic of a bar chart with a red line graph showing an upward trend. Two black silhouettes of people are shown interacting with the chart, one pointing at a bar and the other at the line. The number "24" is printed in small white text at the bottom right of the dark blue bar.
