

MATERIAL / PACE

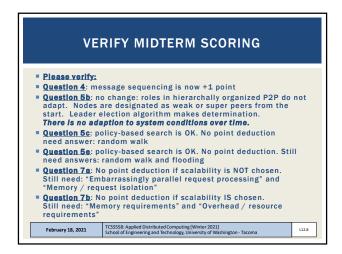

■ Please classify your perspective on material covered in today's class (15 respondents):
■ 1-mostly review, 5-equal new/review, 10-mostly new
■ Average = 5.80 (↓ - previous 6.32)

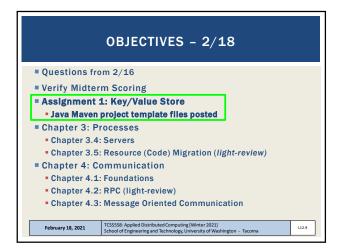

■ Please rate the pace of today's class:
■ 1-slow, 5-just right, 10-fast
■ Average = 5.27 (↓ - previous 5.41)

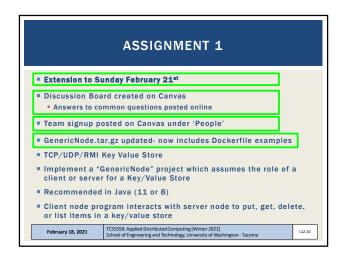

TCSSSS: Applied Distributed Computing (Winter 2021)
School of Engineering and Technology, University of Washington - Tacoma

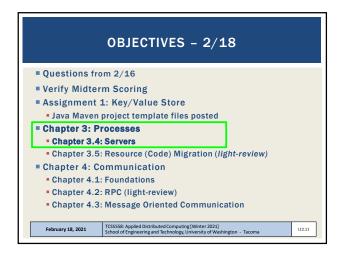

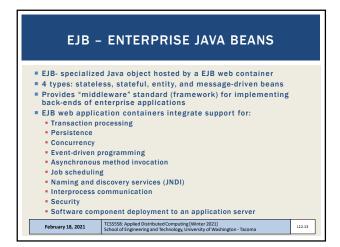

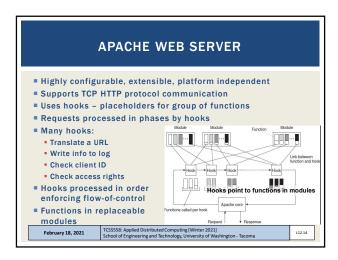

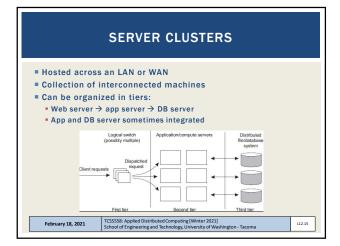

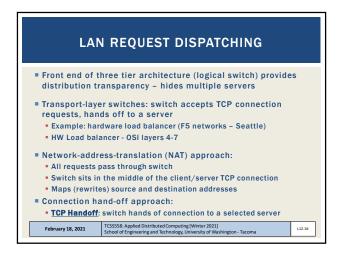

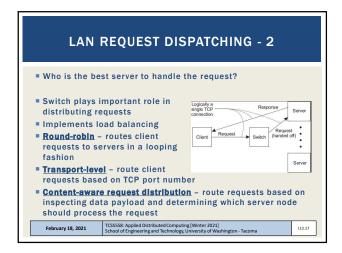

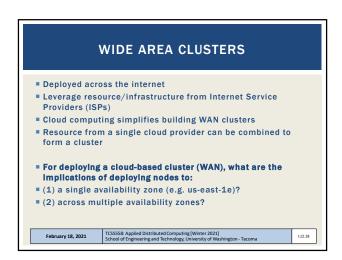

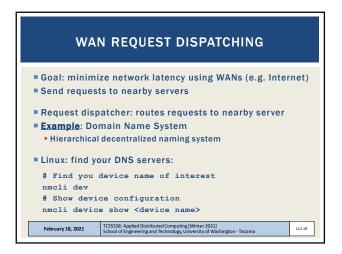

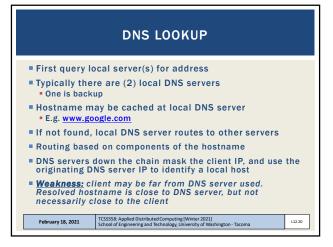

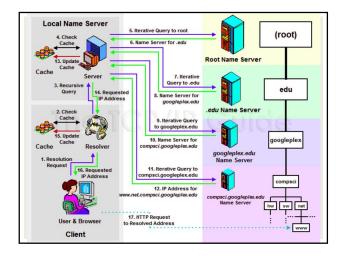

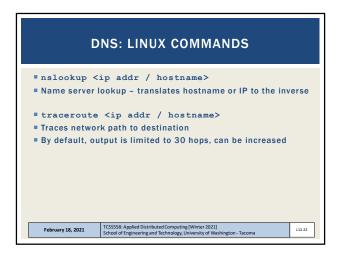

DNS EXAMPLE - WAN DISPATCHING

Ping www.google.com in WA from wireless network:

nslookup: 6 alternate addresses returned, choose (74.125.28.147)

Ping 74.125.28.147: Average RTT = 22.458 ms (11 attempts, 22 hops)

Ping www.google.com in VA (us-east-1) from EC2 instance:

nslookup: 1 address returned, choose 172.217.9.196

Ping 172.217.9.196: Average RTT = 1.278 ms (11 attempts, 13 hops)

From VA EC2 instance, ping WA www.google server

Ping 74.125.28.147: Average RTT 62.349ms (11 attempts, 27 hops)

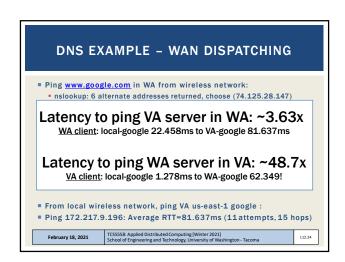

Pinging the WA-local server is ~60x slower from VA

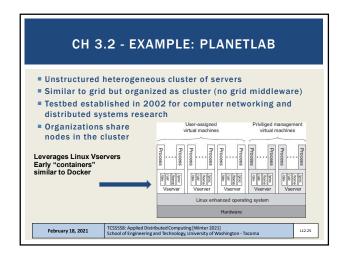

From local wireless network, ping VA us-east-1 google:

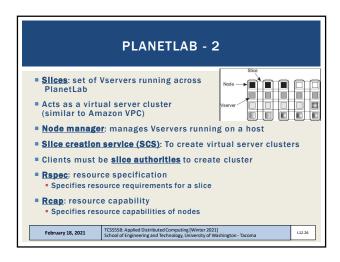

Ping 172.217.9.196: Average RTT=81.637ms (11 attempts, 15 hops)

TCSSSS: Applied Distributed Computing [Winter 2021]
School of Engineering and Technology, University of Washington-Tacoma

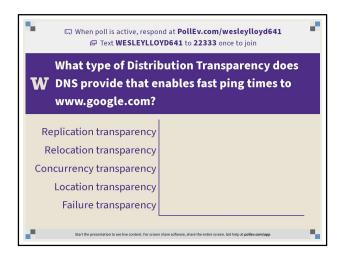

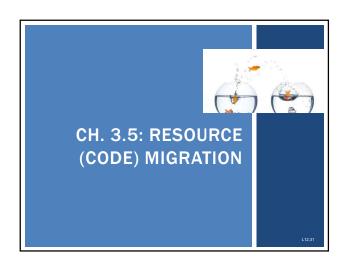

| Provided early "container-like" tool
| Vservers share a single operating system kernel
| Primary task is to support a group of processes
| Provides separation of name spaces
| Linux kernel maps process IDs: host OS → Vservers
| Each Vserver has its own set of libraries and file system
| Similar name separation as the "chroot" command
| Additional isolation provided to prevent unauthorized access among Vservers directory trees

OBJECTIVES - 2/18

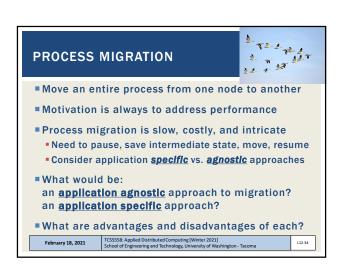

Questions from 2/16
Verify Midterm Scoring
Assignment 1: Key/Value Store
Java Maven project template files posted
Chapter 3: Processes
Chapter 3.4: Servers
Chapter 3.5: Resource (Code) Migration (light-review)
Chapter 4: Communication
Chapter 4.1: Foundations
Chapter 4.2: RPC (light-review)
Chapter 4.3: Message Oriented Communication

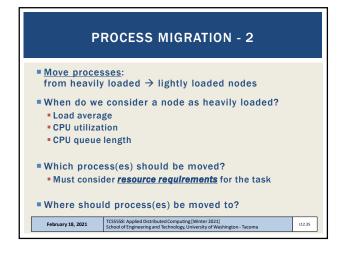

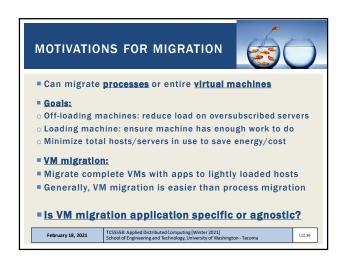

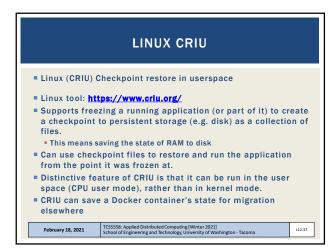

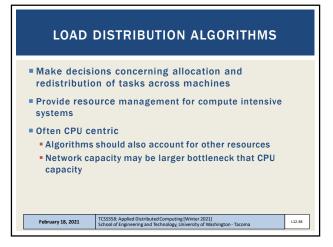

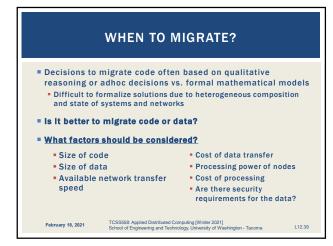

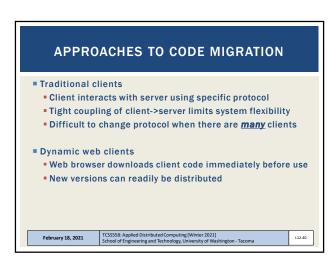

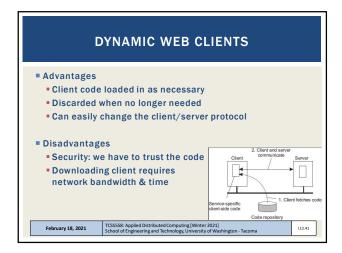

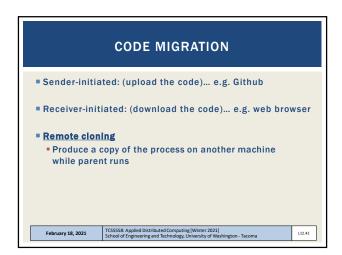

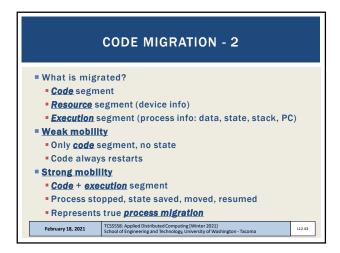

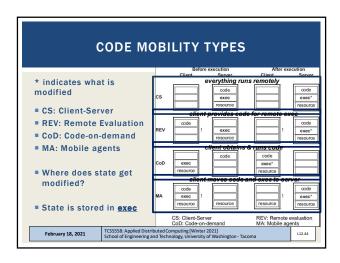

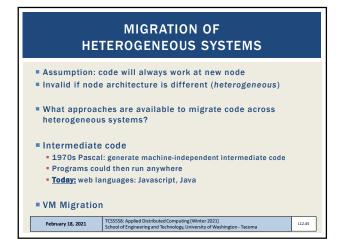

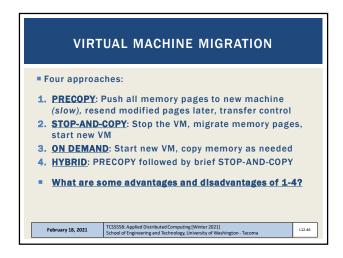

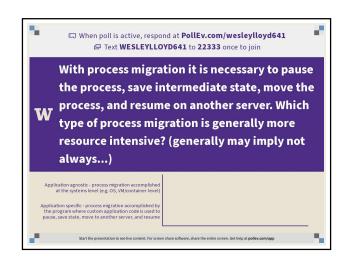

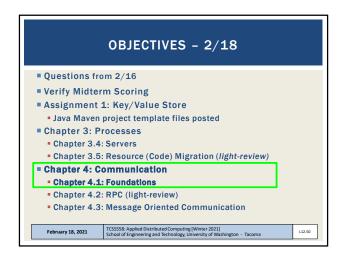

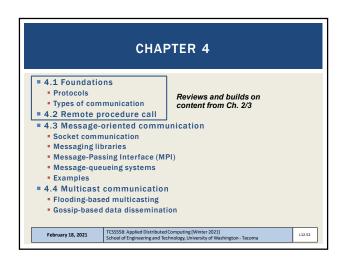

1. PRECOPY: Push all memory pages to new machine (slow), resend modified pages later, transfer control 2. STOP-AND-COPY: Stop the VM, migrate memory pages, start new VM 3. ON DEMAND: Start new VM, copy memory pages as 4. HYBRID: PRECOPY and followed by brief STOP-AND-COPY What are some advantages and disadvantages of 1-4? (+) 1/3: no loss of service (+) 4: fast transfer, minimal loss of service (+) 2: fastest data transfer (+) 3: new VM immediately available (-) 1: must track modified pages during full page copy (-) 2: longest downtime - unacceptable for live services (-) 3: prolonged, slow, migration (-) 3: original VM must stay online for quite a while (-) 1/3: network load while original VM still in service

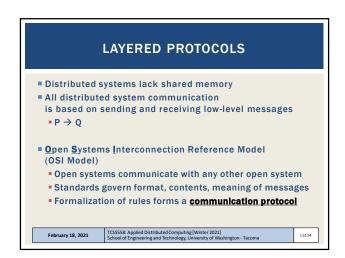

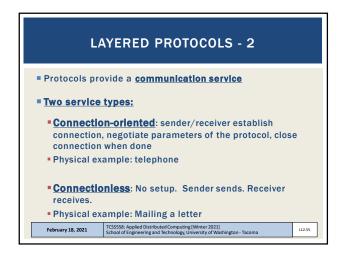

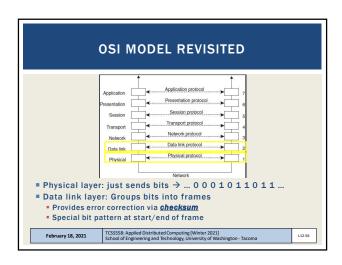

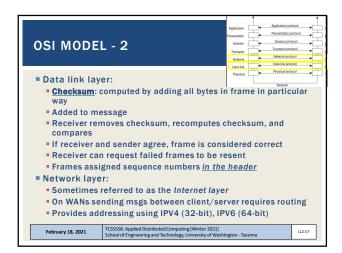

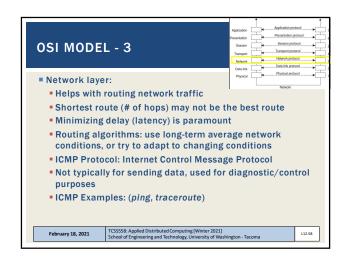

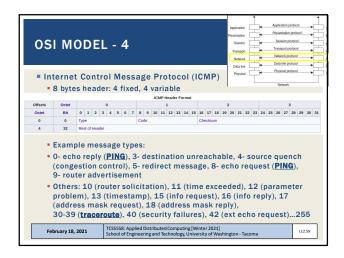

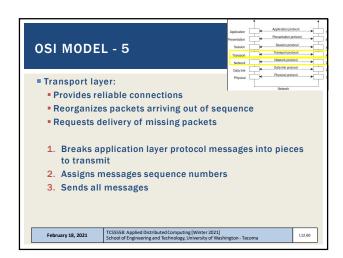

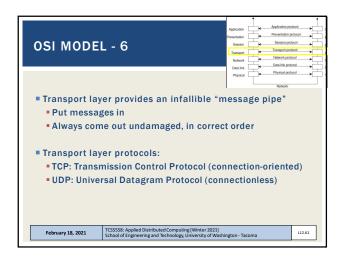

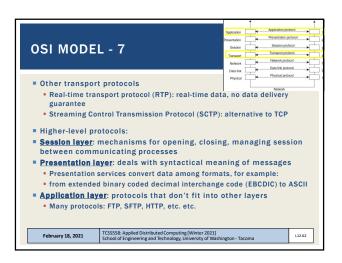

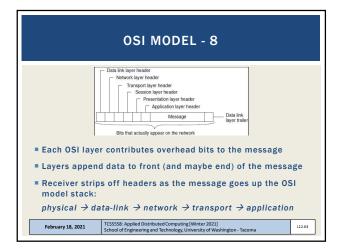

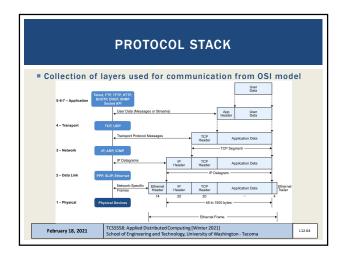

MIDDLEWARE PROTOCOLS

Middleware is reused by many applications
Provide needed functions applications are built and depend upon
For example: communication frameworks/libraries
Middleware offer many general-purpose protocols

Middleware protocol examples:

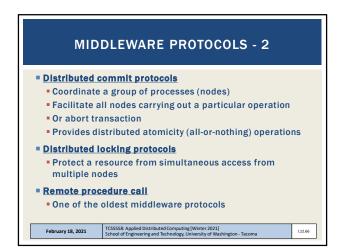

Authentication protocols: supports granting users and processes access to authorized resources
Doesn't fit as an "application specific" protocol
Considered a "Middleware protocol"

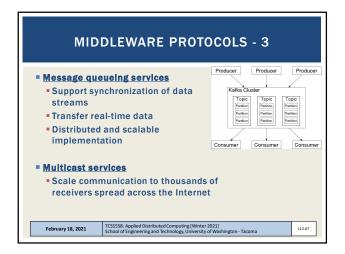

MCSSSSS: Applied Distributed Computing (Winter 2021)
School of Engineering and Technology, University of Washington-Tacoma

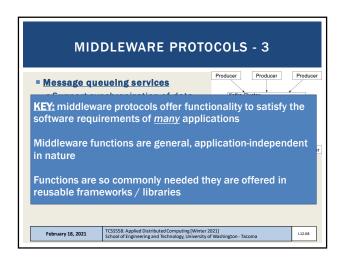

MIDDLEWARE PROTOCOLS

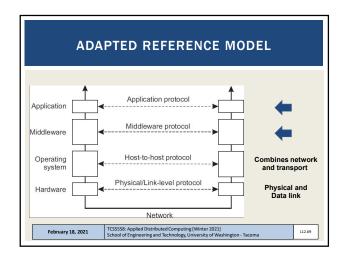

Testing Provide Note of Provided Protocols

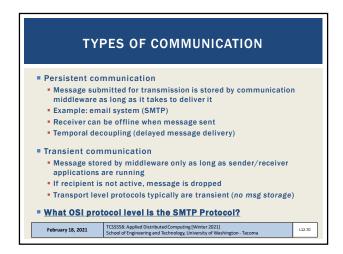

Testing Provided P

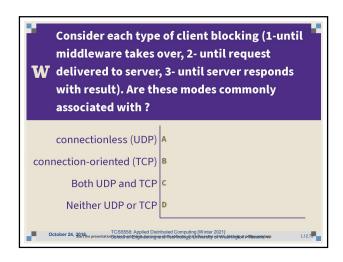

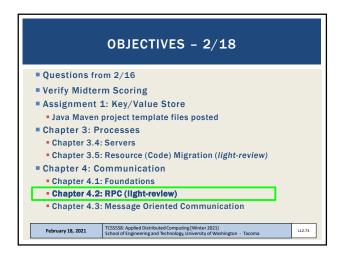

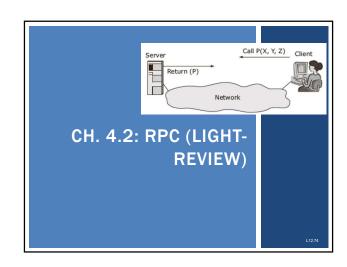

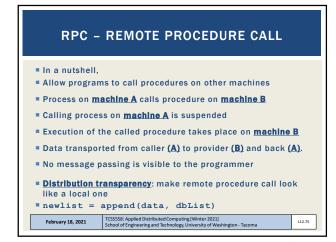

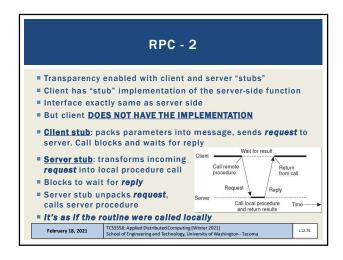

RPC - 3

Server packs procedure results and sends back to client.

Client "request" call unblocks and data is unpacked

Client can't tell method was called remotely over the network... except for network latency...

Call abstraction enables clients to invoke functions in alternate languages, on different machines

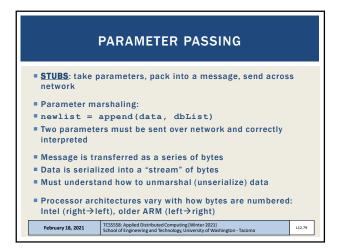

Differences are handled by the RPC "framework"

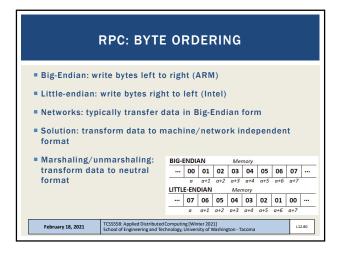

TCSSSSS: Applied Distributed Computing (Winter 2021) School of Engineering and Technology, University of Washington-Tacoma

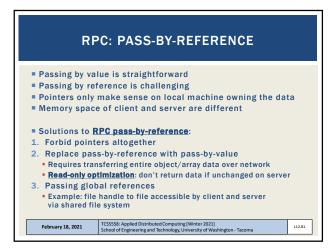

RPC STEPS

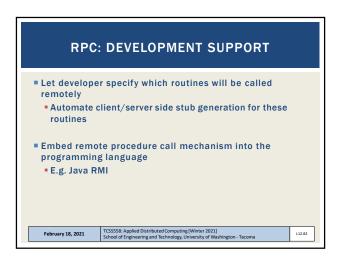

1. Client procedure calls client stub
2. Client stub builds message and calls OS
3. Client's OS send message to remote OS
4. Server OS gives message to server stub
5. Server stub unpacks parameters, calls server
6. Server performs work, returns results to server-side stub
7. Server stub packs results in messages, calls server OS
8. Server OS sends message to client's OS
9. Client's OS delivers message to client stub
10. Client stub unpacks result, returns to client

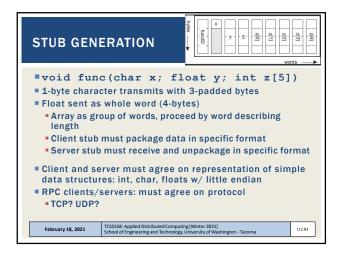

TCSSSS: Applied Distributed Computing [Winter 2021]
School of Engineering and Technology, University of Washington-Tacoma

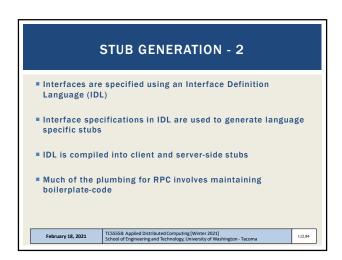

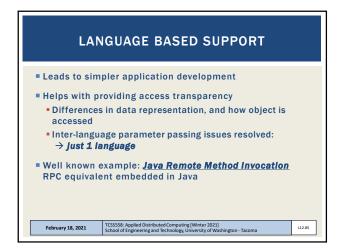

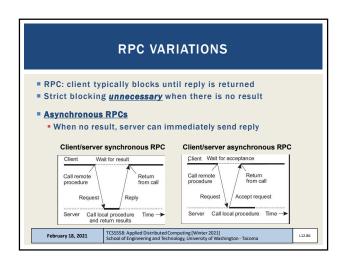

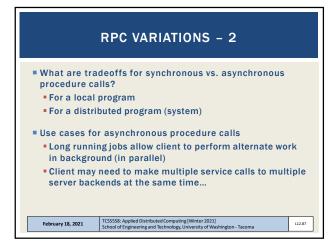

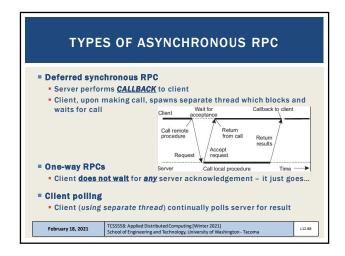

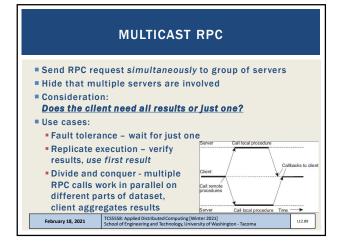

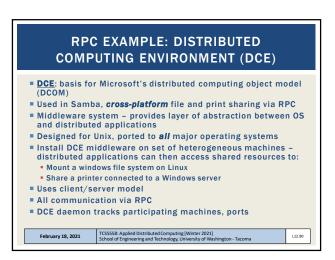

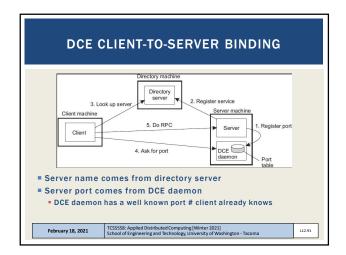

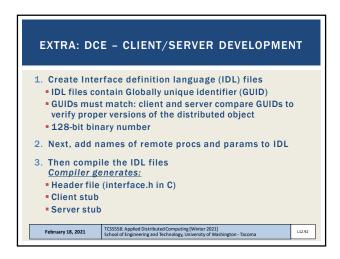

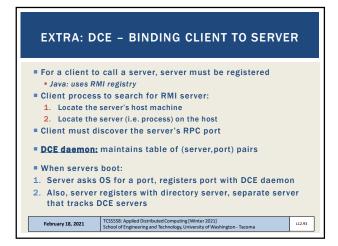

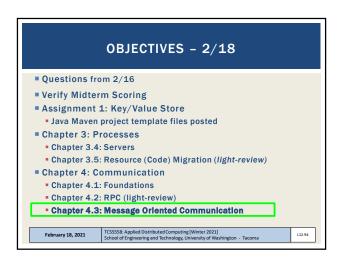

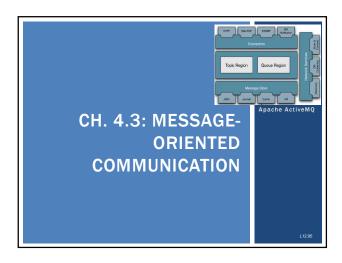

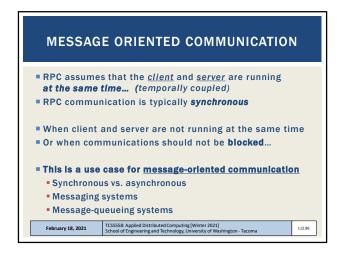

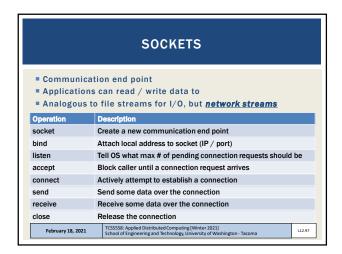

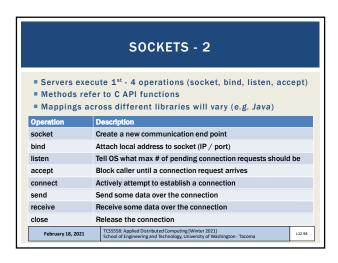

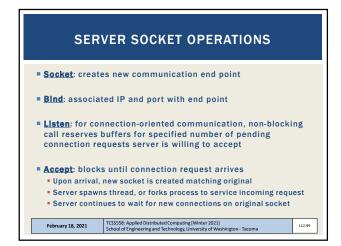

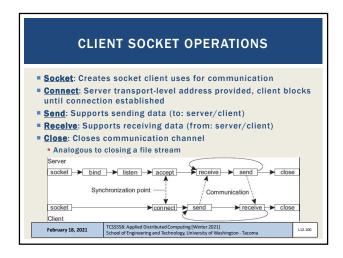

SOCKET COMMUNICATION

Sockets provide primitives for implementing your own TCP/UDP communication protocols

Directly using sockets for transient (non-persisted) messaging is very basic, can be brittle

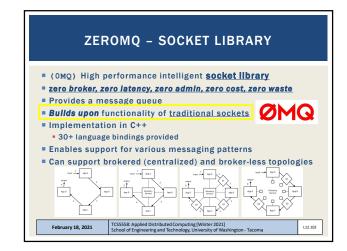

Easy to make mistakes...

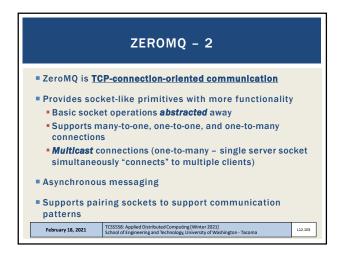

Any extra communication facilities must be implemented by the application developer

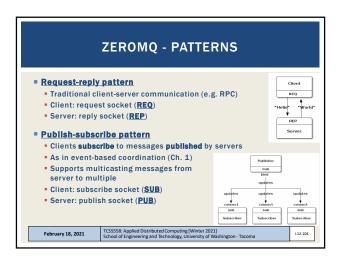

More advanced approaches are desirable

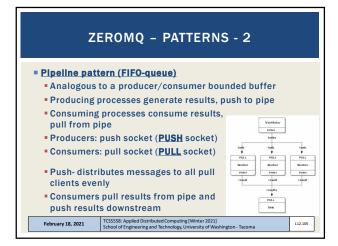

E.g. frameworks with support common desirable functionality

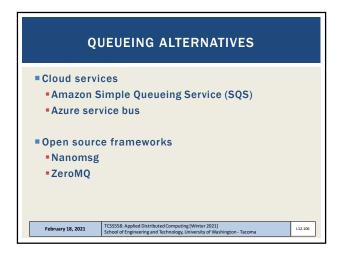

TCSSSS: Applied Distributed Computing [Winter 2021] school of Engineering and Technology, University of Washington - Taxoma

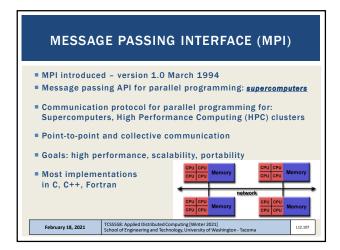

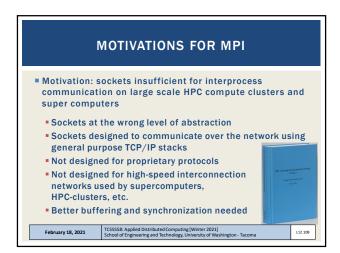

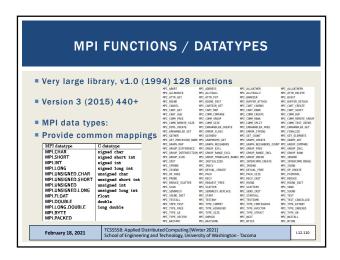

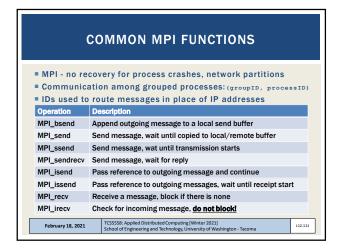

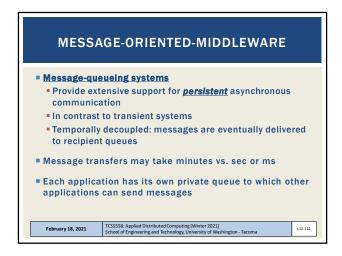

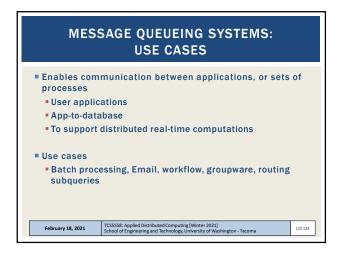

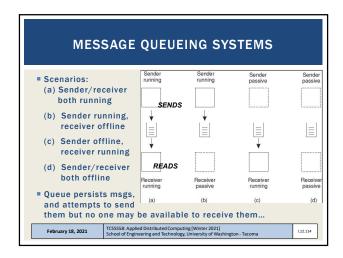

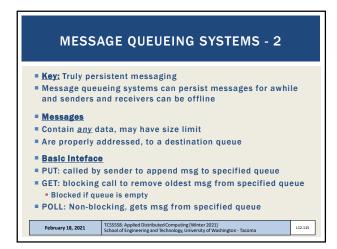

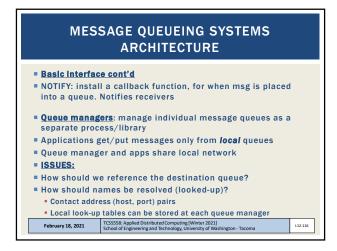

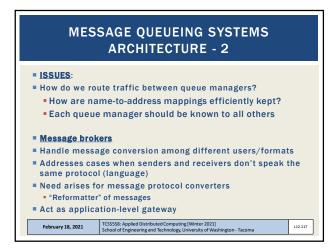

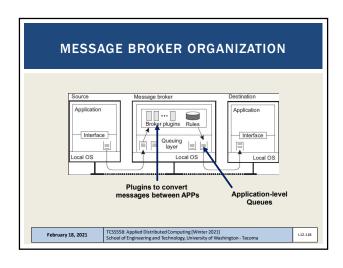

## **AMQP PROTOCOL** Message-queueing systems initially developed to enable legacy applications to interoperate Decouple inter-application communication to "open" messaging-middleware Many are proprietary solutions, so not very open e.g. Microsoft Message Queueing service, Windows NT 1997 Advanced message queueing protocol (AMQP), 2006 Address openness/interoperability of proprietary solutions Open wire protocol for messaging with powerful routing Help abstract messaging and application interoperability by means of a generic open protocol Suffer from incompatibility among protocol versions pre-1.0, 1.0+ TCSS558: Applied Distributed Computing [Winter 2021] School of Engineering and Technology, University of Washington - Tacoma February 18, 2021 L12.119
