TCSS 558: APPLIED DISTRIBUTED COMPUTING

Distributed Systems: Types and Architectures - II

Wes J. Lloyd
School of Engineering
& Technology (SET)
University of Washington - Tacoma

2

ASSIGNMENT 0

- **Preparing for Assignment 0:**
 - Establish AWS Account
 - Standard account
 - Complete AWS Cloud Credits Survey and provide AWS account ID
 - Credits will be automatically loaded by Amazon into accounts
- **Coming Soon - - PREVIEW:**
 - Task 0 - Establish local Linux/Ubuntu environment
 - Task 1 - AWS account setup, obtain user credentials
 - Task 2 - Intro to: Amazon EC2 & Docker: create Dockerfile for Apache Tomcat
 - Task 3 - Create Dockerfile for haproxy
 - Task 4 - Working with Docker-Machine
 - Task 5 - Submit: Results of testing alternate server configs

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.3
------------------	---	------

3

OBJECTIVES - 1/12

- **Questions from 1/10**
- Message Oriented Middleware
- Chapter 1.3 - Types of distributed systems
 - Pervasive Systems: Ubiquitous, Mobile, Sensor networks
- Chapter 2: Distributed System Architectures:
 - Chapter 2.1 - Architectural Styles
 - Layered
 - Object-based
 - Service oriented architecture (SOA)
 - Resource-centered architectures
 - Representational state transfer (REST)
 - Event-based
 - Publish and subscribe (Rich Site Summary RSS feeds)

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.4

TCSS 558 - Online Daily Feedback Survey - 1/5
Not available until Jan 5 at 1:30pm | Due Jan 6 at 10pm | -/1 pts

January 12, 2023 TCSS558: Applied Distributed Computing [Winter 2023] L4.5
School of Engineering and Technology, University of Washington - Tacoma

5

TCSS 558 - Online Daily Feedback Survey - 1/5

Due Jan 6 at 10pm Points 1 Questions 4
Available Jan 5 at 1:30pm - Jan 6 at 11:59pm 1 day Time Limit None

Question 1 0.5 pts

On a scale of 1 to 10, please classify your perspective on material covered in today's class:

1	2	3	4	5	6	7	8	9	10
Mostly Review To Me				Equal New and Review					Mostly New to Me

Question 2 0.5 pts

Please rate the pace of today's class:

1	2	3	4	5	6	7	8	9	10
Slow				Just Right					Fast

January 12, 2023 TCSS558: Applied Distributed Computing [Winter 2023] L4.6
School of Engineering and Technology, University of Washington - Tacoma

6

MATERIAL / PACE

- Please classify your perspective on material covered in today's class (31 respondents):
 - 1-mostly review, 5-equal new/review, 10-mostly new
 - **Average - 5.94** (↓ - *previous 6.12*)
- Please rate the pace of today's class:
 - 1-slow, 5-just right, 10-fast
 - **Average - 5.30** (↓ - *previous 5.43*)

L4.7

7

FEEDBACK FROM 1/10

- **What are some examples of ACID properties?**
- ACID properties are the 4 key properties of ACID transactions
- ACID transactions guarantee that each data write (C), read (R), or modification (U/D) are:
 - **Atomic**- all or no statements of a transaction (C R U D) are executed
 - **Consistent**- data (copies) will be consistent. No data corruption
 - **Isolated**- transactions from users don't interfere w/ each other
 - **Durable**- in the event of system failure, data updates are saved
- ACID transactions have highest possible data reliability and integrity
- Without ACID transactions, on power loss, some data may be saved, but other data not – this results in an inconsistent state that is difficult and time consuming to recover from

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.8

8

ACID PROPERTIES

ACID Properties in DBMS

```
graph LR; ACID[ACID] --> A[A = Atomicity]; ACID --> C[C = Consistency]; ACID --> I[I = Isolation]; ACID --> D[D = Durability]; A --> A_desc[The entire transaction takes place at once or doesn't happen at all.]; C --> C_desc[The database must be consistent before and after the transaction.]; I --> I_desc[Multiple Transactions occur independently without interference.]; D --> D_desc[The changes of a successful transaction occurs even if the system failure occurs.];
```

------------------	---	------

9

FEEDBACK - 2

- ***What are the specific differences between Cluster computing and Grid computing?***

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.10
------------------	---	-------

10

CLUSTER COMPUTING

Essentially a group of high-end systems connected through a LAN

- Homogeneous: same OS, near-identical hardware
- Single managing node

Credit:
 Van Steen, M., 2017. Distributed systems.

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.11
------------------	---	-------

11

GRID COMPUTING

- Is the aggregation of nodes from everywhere
- Nodes are
 - Heterogeneous
 - Dispersed across several organizations
 - Span a wide-area network (such as the Internet)

GRID SYSTEM

Credit:
<https://jimsgnblog.blogspot.com/2017/10/grid-computing.html>

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.12
------------------	---	-------

12

FEEDBACK - 3

- **What's the clear difference between openness and (distribution) transparency?**
- **Openness**
 - Support for interoperability, portability, extensibility
 - Often supported via well-defined interfaces
- **Distribution transparency**
 - Hide from users the fact that a system is actually distributed
 - Goal enables users to use a distributed system without specialized knowledge or coupling to specific nodes
 - Different types of transparency are considered
 - Total distribution transparency is unrealistic and likely unwanted

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.13

13

FEEDBACK - 4

- **What's the difference between consistency and concurrency?**
- **Consistency**
 - Every node (replica) has the same view of data at a given point in time irrespective of whichever client has updated the data
- **Concurrency**
 - Multiple operations or requests processed simultaneously
 - If two concurrent transactions act on the same data, one transaction must go before another
 - One transaction will be blocked, and must wait for the other to finish

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.14

14

DISTRIBUTED INFORMATION SYSTEMS

- ***What are some examples of Distributed Information Systems, their key components, and distributed transactions?***
- 'Distributed Information System' refers to a set of distributed applications that shares data
- Early on organizations had many networked applications hosted via the Internet
- A networked application ran on a server to make it available to remote clients
- Clients combined requests for different applications, sent the requests, collected responses, and presented a coherent result to the user
- Integration was solely in the client
- Next step was to enable direct application-to-application communication, leading to enterprise application integration

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.15

15

DISTRIBUTED INFORMATION SYSTEMS - 2

- The evolution of ***distributed information systems*** is supported by an ever-evolving array of communication technologies and methods
 - Notion of transactions and ACID transactions
 - Transaction Processing Monitor – central coordinator responsible for coordinating the execution of a transaction across a distributed system
 - Remote Procedure Call (RPC)
 - Distributed Objects (CORBA, Java, .NET remoting)
 - Message Oriented Middleware (MOM)

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.16

16

OBJECTIVES - 1/12

- Questions from 1/10
- **Message Oriented Middleware**
- Chapter 1.3 - Types of distributed systems
 - Pervasive Systems: Ubiquitous, Mobile, Sensor networks
- Chapter 2: Distributed System Architectures:
 - Chapter 2.1 - Architectural Styles
 - Layered
 - Object-based
 - Service oriented architecture (SOA)
 - Resource-centered architectures
 - Representational state transfer (REST)
 - Event-based
 - Publish and subscribe (Rich Site Summary RSS feeds)

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.17
------------------	---	-------

17

MESSAGE-ORIENTED MIDDLEWARE

- Publish and subscribe systems:
 - Rabbit MQ, Apache Kafka, AWS SQS
- Reduces tight coupling of RPC/RMI
- Applications indicate interest for specific type(s) of messages by sending requests to logical contact points
- Communication middleware delivers messages to subscribing applications

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.18
------------------	---	-------

18

CHALLENGES WITH VARIOUS APPLICATION INTEGRATION METHODS

- Integration via shared data files and transfers
 - Shared data files (e.g. XML)
 - Leads to file management challenges (concurrent updates, etc.)
- Shared database
 - Centralized DB, transactions to coordinate changes among users
 - Common data schema required – can be challenging to derive
 - For many reads and updates, shared DB becomes bottleneck (*limited scalability*)
- Remote procedure call – app A executes on and against app B data. App A lacks direct access to app B data.
- Messaging middleware - ensures nodes temporarily offline later on, can receive messages

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.19
------------------	---	-------

19

------------------	---	-------

20

PERVASIVE SYSTEMS

- Existing everywhere, widely adopted...
- Combine current network technologies, wireless computing, voice recognition, internet capabilities and AI to create an environment where connectivity of devices is embedded, unobtrusive, and always available
- Many sensors infer various aspects of a user's behavior
 - Myriad of actuators to collect information, provide feedback
- **TYPES OF PERVASIVE SYSTEMS:**
 - Ubiquitous computing systems
 - Mobile systems
 - Sensor networks

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.21
------------------	---	-------

------------------	---	-------

22

PERVASIVE SYSTEM TYPE: UBIQUITOUS COMPUTING SYSTEMS		
<ul style="list-style-type: none">▪ Pervasive and continuously present▪ Goal: embed processors everywhere (day-to-day objects) enabling them to communicate information▪ Requirements for a ubiquitous computing system:<ul style="list-style-type: none">▪ Distribution – devices are networked, distributed, and accessible transparently▪ Interaction – unobtrusive (low-key) between users and devices▪ Context awareness – optimizes interaction▪ Autonomy – devices operate autonomously, self-managed▪ Intelligence – system can handle wide range of dynamic actions and interactions		
January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.23

23

UBIQUITOUS COMPUTING DEVICES EXAMPLES		
<ul style="list-style-type: none">▪ Apple Watch▪ Amazon Echo Speaker▪ Amazon EchoDot (single speaker design)▪ Fitbit▪ Electronic Toll Systems▪ Smart Traffic Lights▪ Self Driving Cars▪ Home Automation		
January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.24

24

UBIQUITOUS COMPUTING SYSTEM EXAMPLE

- **Domestic ubiquitous computing environment example:**
- Interconnect lighting and environmental controls with personal biometric monitors woven into clothing so that illumination and heating/cooling control for a room might be modulated, continuously and imperceptibly
- IoT technology helps enable ubiquitous computing

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]

School of Engineering and Technology, University of Washington - Tacoma

L4.26

26

PERVASIVE SYSTEM TYPE: MOBILE SYSTEMS

- Emphasis on mobile devices, e.g. smartphones, tablet computers
- Devices: remote controls, pagers, active badges, car equipment, various GPS-enabled devices,
- Devices move: *where is the device?*
- Changing location: leverage mobile adhoc network (MANET)
- MANET is an ad hoc network consisting of mobile devices. The network is continuously self-configuring. Devices use wireless connections to constitute the network.
 - Key points: self configuring, no permanent infrastructure
- VANET (Vehicular Ad Hoc Network), is a type of MANET that allows vehicles to communicate with roadside equipment.

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.27

27

OTHER MANETS

- SPAN - Smart phone ad-hoc network
 - Peer-to-peer networks leveraging bluetooth and wifi available from smart phones without relying on cellular networks, wireless access points, or traditional network infrastructure
- iMANET - Internet based mobile ad-hoc network
 - Ad hoc networks that consists of both mobile devices and Internet-gateway nodes which allows the network to access the Internet and hence span beyond a local ad hoc network

January 12, 2023

School of Engineering and Technology, University of Washington - Tacoma

L4.28

28

OBJECTIVES - 1/12

- Questions from 1/10
- Message Oriented Middleware
- Chapter 1.3 - Types of distributed systems
 - **Pervasive Systems: Ubiquitous, Mobile, Sensor networks**
- Chapter 2: Distributed System Architectures:
 - Chapter 2.1 - Architectural Styles
 - Layered
 - Object-based
 - Service oriented architecture (SOA)
 - Resource-centered architectures
 - Representational state transfer (REST)
 - Event-based
 - Publish and subscribe (Rich Site Summary RSS feeds)

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.29
------------------	---	-------

29

PERVASIVE SYSTEM TYPE: SENSOR NETWORKS

- Tens, to hundreds, to thousands of small nodes
- Simple: small memory/compute/communication capacity
- Wireless, battery powered (or battery-less)
- Limited: restricted communication, constrained power
- Equipped with sensing devices
- Some can act as actuators (control systems)
 - Example: enable sprinklers upon fire detection
- Sensor nodes organized in neighborhoods
- Scope of communication:
 - Node - neighborhood - system-wide

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.30
------------------	---	-------

30

PERVASIVE SYSTEM TYPE: SENSOR NETWORKS - 2

- Collaborate to process sensor data in app-specific manner
- Provide mix of data collection and processing
- **Nodes may implement a distributed database**
- Database organization: centralized to decentralized
- In network processing: forward query to all sensor nodes along a tree to aggregate results and propagate to root
- Is aggregation simply data collection?
- Are all nodes homogeneous?
- Are all network links homogeneous?
- How do we setup a tree when nodes have heterogeneous power and network connection quality?

January 12, 2023

------------------	---	-------

33

SENSOR NETWORKS - 3

■ What are some unique requirements for sensor networks middleware?

- Sensor networks may consist of different types of nodes with different functions
- Nodes may often be in suspended state to save power
 - Duty cycles (1 to 30%), strict energy budgets
- Synchronize communication with duty cycles
- How do we manage membership when devices are offline?

37

Identify the type of distributed system: Seismic monitoring network - warning system for earthquakes

HPC, Cluster, Grid, Cloud

Distributed information system

Pervasive system: ubiquitous computing system

Pervasive system: mobile system

Pervasive system: sensor network

Start the presentation to see live content. For screen share software, share the entire screen. Get help at pollev.com/app

38

EXAMPLES OF DISTRIBUTED SYSTEMS

- **Classify the following types of distributed systems:**
- Web search engine
- Assisted living home monitoring system for elderly
- Ecommerce websites: e.g. eBay, Amazon
- Wikipedia: online encyclopedia
- Amazon Elastic Compute Cloud (EC2)
- Massively multiplayer online games (MMO)
- Seismic monitoring network: warning system for earthquakes
- Worldwide Large Hadron Collider (LHC) Computing Grid
- Hospital health informatics and records system
- Canvas: web-based learning environment
- Modern automobile with self-driving features

42

DISTRIBUTED SYSTEM ARCHITECTURES

- Provides logical organization of a distributed system into software **components**
- **Logical**: How system is perceived, modeled
 - *The OO/component abstractions*
 - *The “idealists” view of the system*
- **Physical** – how it really exists
 - *The “realist” view of the system*
- **Middleware**
 - Helps separate application from platforms
 - Helps organize and assemble distributed components
 - Helps components communicate
 - Enables system to be extended
 - Supports replication within the distributed system
 - Provides “realization” of the architecture

L4.44

44

ARCHITECTURAL BUILDING BLOCKS

- **COMPONENT:** modular unit with well-defined, required, and provided **interfaces** that is replaceable within its environment
- Components can be replaced while system is running
- Interfaces must remain the same
- Preserving interfaces enables interoperability
- **CONNECTOR:** enables flow of **control** and **data** between components
- Distributed system architectures are conceived using components and connectors

51

LAYERED ARCHITECTURES - 3

- Consider an architecture with 5 layers
- Does a client interacting with “Layer 5” of the distributed system need to be concerned with details regarding the implementation of lower layers (layers 1, 2, 3, 4) ?

```
graph TD; L_N[Layer N] --> L_N1[Layer N-1]; L_N1 -.- L_2[Layer 2]; L_2 --> L_1[Layer 1];
```

------------------	---	-------

52

COMMUNICATION-PROTOCOL STACKS

- Example: pure-layered organization
 - Each layer offers an interface specifying functions of the layer
 - Communication protocol: rules used for nodes to communicate
 - Layer provides a **service**
 - **Interface** makes service available
 - **Protocol** implements communication for a layer
-
- **New services can be built atop of existing layers to reuse lower level implementation(s)**
 - Abstractions make it easier to reuse existing layers which already implement communication basics

54

TCP HEADER

Transmission Control Protocol (TCP) Header

20-60 bytes

source port number 2 bytes		destination port number 2 bytes	
sequence number 4 bytes			
acknowledgement number 4 bytes			
data offset 4 bits	reserved 3 bits	control flags 9 bits	window size 2 bytes
checksum 2 bytes		urgent pointer 2 bytes	
optional data 0-40 bytes			

January 12, 2023

School of Engineering and Technology, University of Washington - Tacoma

L4.55

55

IP HEADER

- Source / Destination IP Addr
- IPv4: 32bits / 4 bytes
- IPv6: 128bits / 16 bytes

0	4	8	16	19	31
Version	Header Length	Service Type	Total Length		
Identification			Flags	Fragment Offset	
TTL	Protocol	Header Checksum			
Source IP Addr					
Destination IP Addr					
Options				Padding

L4.56

56

TRANSMISSION CONTROL PROTOCOL (TCP)

- TCP (layer 4) provides easy to use API
- API supports:
 - setup, tear down of connection(s)
 - sending and receiving of messages
- TCP preserves ordering of transferred data
- TCP detects and corrects lost data

- But TCP is “protocol” agnostic
 - A protocol is a language of messages exchanged to enable communication
 - Application layer communication is programming language agnostic
 - Code can be written in many programming languages to “speak” the “language” of a custom protocol known as an **APPLICATION PROTOCOL**
- What should the application protocol say?

58

APPLICATION LAYERING

- **Distributed application example: Internet search engine**

The diagram illustrates the architecture of an Internet search engine, organized into three logical layers:

- User-interface level:** Contains the **User interface**.
- Processing level:** Contains the **Query generator**, **Ranking algorithm**, and **HTML generator**.
- Data level:** Contains the **Database with Web pages**.

Flow of data and control:

- The **User interface** sends a **Keyword expression** to the **Query generator**.
- The **Query generator** sends **Database queries** to the **Database with Web pages**.
- The **Database with Web pages** returns **Web page titles with meta-information** to the **Ranking algorithm**.
- The **Ranking algorithm** produces a **Ranked list of page titles**.
- The **Ranked list of page titles** is sent to the **HTML generator**.
- The **HTML generator** produces an **HTML page containing list**.
- The **HTML page containing list** is sent back to the **User interface**.

------------------	---	-------

60

APPLICATION LAYERING

- Three logical layers of distributed applications
 - The data level (M)
 - Application interface level (V)
 - The processing level (C)

- Model view controller architecture – distributed systems
 - Model – database - handles data persistence
 - View – user interface - also includes APIs
 - Controller – middleware / business logic

------------------	---	-------

61

OBJECTIVES – 1/12

- Questions from 1/10
- Message Oriented Middleware
- Chapter 1.3 – Types of distributed systems
 - Pervasive Systems: Ubiquitous, Mobile, Sensor networks
- Chapter 2: Distributed System Architectures:
 - Chapter 2.1 – Architectural Styles
 - Layered
 - **Object-based**
 - **Service oriented architecture (SOA)**
 - Resource-centered architectures
 - Representational state transfer (REST)
 - Event-based
 - Publish and subscribe (Rich Site Summary RSS feeds)

------------------	---	-------

62

OBJECT-BASED ARCHITECTURES

- Enables loose and flexible component organization
- Objects == components
- Enable distributed node interaction via function calls over the network
- Began with C - Remote Procedure Calls (RPC)
 - Straightforward: package up function inputs, send over network, transfer results back
 - Language independent
 - In contrast to web services, RPC calls originally were more intimate in nature
 - Procedures more “coupled”, not as independent
 - The goal was not to decouple and widgetize everything

January 12, 2023

School of Engineering and Technology, University of Washington - Tacoma

L4.63

63

OBJECT-BASED ARCHITECTURES - 2

- Distributed objects Java- Remote Method Invocation (RMI)
 - Adds object orientation concepts to remote function calls
 - Clients bind to proxy objects
 - Proxy provide an object interface which transfers method invocation over the network to the remote host
- How do we replicate objects?
 - Object marshalling – serialize data, stream it over network
 - Unmarshalling- create an object from the stream
 - Unmarshall local object copies on the remote host
 - JSON, XML are some possible data formats

School of Engineering and Technology, University of Washington - Tacoma

L4.64

64

SERVICE ORIENTED ARCHITECTURE

- Services provide always-on encapsulated functions over the internet/web
- Leverage redundant cloud computing infrastructure
- Services may:
 - Aggregate multiple languages, libraries, operating systems
 - Include (wrap) legacy code
- Many software components may be involved in the implementation
 - Application server(s), relational database(s), key-value stores, in memory-cache, queue/messaging services

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

L4.67

67

SERVICE ORIENTED ARCHITECTURE - 2

- Are more easily developed independently and shared vs. systems with distributed object architectures
- Less coupling
- An error while invoking a distributed object may crash the system
- An error calling a service (e.g. mismatching the interface) generally does not result in a system crash

------------------	---	-------

69

RESOURCE BASED ARCHITECTURES

- Motivation:
 - Increasing number of services available online
 - Each with specific protocol(s), methods of interfacing
 - Connecting services w/ different TCP/IP protocols
→ integration nightmare
 - Need for specialized client for each service that speaks the application protocol "language"...
- Need standardization of interfaces
 - Make services/components more pluggable
 - Easier to adopt and integrate
 - Common architecture

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.70
------------------	---	-------

70

REST SERVICES

- Representational State Transfer (REST)
- Built on HTTP
- Four key characteristics:
 1. Resources identified through single naming scheme
 2. Services offer the same interface
 - Four operations: GET PUT POST DELETE
 3. Messages to/from a service are fully described
 4. After execution server forgets about client
 - Stateless execution

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.71
------------------	---	-------

71

HYPERTEXT TRANSPORT PROTOCOL (HTTP)

- An ASCII-based request/reply protocol for transferring information on the web
- HTTP request includes:
 - request method (GET, POST, etc.)
 - Uniform Resource Identifier (URI)
 - HTTP protocol version understood by the client
 - headers—extra info regarding transfer request
- HTTP response from server
 - Protocol version & status code →
 - Response headers
 - Response body

HTTP status codes:

2xx — *all is well*

3xx — *resource moved*

4xx — *access problem*

5xx — *server error*

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.72
------------------	---	-------

72

REST-FUL OPERATIONS

Operation	Description	
PUT	Create a new resource	(C)reate
GET	Retrieve state of a resource in some format	(R)ead
POST	Modify a resource by transferring a new state	(U)pdate
DELETE	Delete a resource	(D)elete

- Resources often implemented as objects in OO languages
- REST is weak for tracking state
- Generic REST interfaces enable ubiquitous “so many” clients

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.73
------------------	---	-------

73

EXAMPLE: AMAZON S3

- Amazon S3 offers a REST-based interface
- Requires signing HTTP authorization header or passing authentication parameters in the URL query string
- REST: GET/PUT/POST/DELETE
- SOAP: 16 operations, moving toward deprecation
- Python boto ~50 operations (SDK for Python)
- SDKs for other languages

- AWS SDKs and Explorers
 - Set Up the AWS CLI
 - Using the AWS SDK for Java
 - Using the AWS SDK for .NET
 - Using the AWS SDK for PHP and Running PHP Examples
 - Using the AWS SDK for Ruby - Version 3
 - Using the AWS SDK for Python (Boto)

January 12, 2023	TCSS558: Applied Distributed Computing [Winter 2023] School of Engineering and Technology, University of Washington - Tacoma	L4.74
------------------	---	-------

74

REST - 2

- Defacto web services protocol
- Requests made to a URI – uniform resource identifier
- Supersedes SOAP – Simple Object Access Protocol
- Access and manipulate web resources with a predefined set of stateless operations (known as web services)
- Responses most often in JSON, also HTML, ASCII text, XML, no real limits as long as text-based
- curl – generic command-line REST client:
<https://curl.haxx.se/>

PUBLISH-SUBSCRIBE ARCHITECTURES

- Enables separation between processing and coordination
- Types of coordination: temporal and referential coupling:

	Temporally coupled (at the same time)	Temporally decoupled (at different times)
Referentially coupled (<i>dependent on name</i>)	Direct Explicit synchronous service call	Mailbox Asynchronous by name (address)
Referentially decoupled (<i>name not required</i>)	Event-based Event notices published to shared bus, w/o addressing	Shared data space Processes write tuples to a shared data space

Publish and subscribe architectures

January 12, 2023
TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma
LS.79

79

PUBLISH-SUBSCRIBE ARCHITECTURES - 2

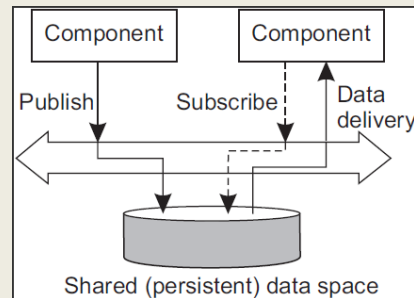

- **Event-based coordination**
- Processes do not know about each other explicitly
- **Processes:**
 - **Publish:** a notification describing an event
 - **Subscribe:** to receive notification of specific kinds of events
- Assumes subscriber is presently up (*temporally coupled*)
- Subscribers must actively **MONITOR** event bus

January 12, 2023
TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma
LS.80

80

PUBLISH SUBSCRIBE ARCHITECTURES - 3

- **Shared data space**
- Full decoupling (name and time)
- Processes publish “tuples” to shared dataspace (publish)
- Processes provide search pattern to find tuples (subscribe)
- When tuples are added, subscribers are notified of matches
- **Key characteristic:**
Processes have no explicit reference to each other

January 12, 2023

TCSS558: Applied Distributed Computing [Winter 2023]
School of Engineering and Technology, University of Washington - Tacoma

LS.81

81

PUBLISH SUBSCRIBE ARCHITECTURES - 4

- Subscriber describes events interested in
- Complex descriptions are intensive to evaluate and fulfil
- **Middleware will:**
- Publish matching notification and data to subscribers
 - Common if middleware lacks storage
- Publish only matching notification
 - Common if middleware provides storage facility
 - Client must explicitly fetch data on their own
- Publish and subscribe systems are generally scalable
- **What would reduce the scalability of a publish-and-subscribe system?**
